# Chapter 1

## gdsl

### 1.1 Introduction

This is the gdsl (Release 1.8) documentation.

### 1.2 About

The Generic Data Structures Library (GDSL) is a collection of routines for generic data structures manipulation. It is a portable and re-entrant library fully written from scratch in pure ANSI C. It is designed to offer for C programmers common data structures with powerful algorithms, and hidden implementation. Available structures are lists, queues, stacks, hash tables, binary trees, binary search trees, red-black trees, 2D arrays, permutations, heaps and interval heaps.

### 1.3 Copyright

Copyright (C) 1998-2017 Nicolas Darnis <ndarnis@free.fr>.

GDSL is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

GDSL is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with GDSL. If not, see <<http://www.gnu.org/licenses/>>.

## 1.4 Authors

Nicolas Darnis <ndarnis@free.fr>: all GDSL modules excepted the ones listed below.

Peter Kerpedjiev <pkerpedjiev@gmail.com>: interval\_heap module.

## 1.5 Project Manager

Nicolas Darnis <ndarnis@free.fr>.

## 1.6 Thanks

This is the list of persons (in randomized order) the GDSL Team want to thanks for their direct and/or indirect help:

- Vincent Vidal <vidal@cril.univ-artois.fr>

For his bug report in hash\_insert method and into **gdsl.h** (p. 255).

- Martin Pichlmair <pi@igw.tuwien.ac.at>

For his patch to compile GDSL under OSX.

- Mathieu Clabaut <mathieu.clabaut@gmail.com>

For his bug report in **gdsl\_stack\_insert()** (p. 235).

- Xavier De Labouret <Xavier.de\_Labouret@cvf.fr>

For his bug report in **gdsl\_hash\_search()** (p. 108).

- Kaz Kylheku <kaz@ashi.footprints.net>

For his KazLib from wich the deletion algorithm for gdsl\_rbtrees.c is inspired.

- David Lewin <dlewin@free.fr>

For his bug report in **gdsl\_list\_map\_backward()** (p. 158), and for the problem of re-defining bool type in **gdsl\_types.h** (p. 270).

- Torsten Luetzgert <t.luetzgert@combox.de>

For his gdsI.spec file to build GDSL's RPM package.

- Charles F. Randall <cfriv@yahoo.com>

For his patch to compile GDSL under FreeBSD.

- Sascha Alexander Jopen <jopen@informatik.uni-bonn.de>

For his patch to compile GDSL under Android OS.

- Peter Kerpedjiev <pkerpedjiev@gmail.com>

For his gdsI\_interval\_heap module.

- Benny Pasternak <benny.pk>

For his is bug report in gdsI\_rbtrees\_map\_infix function.

The GDSL Team.

## Chapter 2

# Module Index

### 2.1 Modules

Here is a list of all modules:

Low level binary tree manipulation module . . . . .	9
Low-level binary search tree manipulation module . . . . .	31
Low-level doubly-linked list manipulation module . . . . .	48
Low-level doubly-linked node manipulation module . . . . .	59
Main module . . . . .	69
2D-Arrays manipulation module . . . . .	70
Binary search tree manipulation module . . . . .	80
Hashtable manipulation module . . . . .	95
Heap manipulation module . . . . .	112
Interval Heap manipulation module . . . . .	125
Doubly-linked list manipulation module . . . . .	139
Various macros module . . . . .	175
Permutation manipulation module . . . . .	177
Queue manipulation module . . . . .	195
Red-black tree manipulation module . . . . .	209
Sort module . . . . .	225
Stack manipulation module . . . . .	227
GDSL types . . . . .	242

## Chapter 3

#### Typedefs

- typedef struct \_gdsl\_bintree \* **\_gdsl\_bintree\_t**  
*GDSL low-level binary tree type.*
- typedef int(\* **\_gdsl\_bintree\_map\_func\_t**)(const **\_gdsl\_bintree\_t** TREE, void \*USER\_DATA)  
*GDSL low-level binary tree map function type.*
- typedef void(\* **\_gdsl\_bintree\_write\_func\_t**)(const **\_gdsl\_bintree\_t** TREE, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*GDSL low-level binary tree write function type.*

## Functions

- **\_gdsl\_bintree\_t \_gdsl\_bintree\_alloc** (const **gdsl\_element\_t** E, const **\_gdsl\_bintree\_t** LEFT, const **\_gdsl\_bintree\_t** RIGHT)  
*Create a new low-level binary tree.*
- **void \_gdsl\_bintree\_free** (**\_gdsl\_bintree\_t** T, const **gdsl\_free\_func\_t** FREE\_F)  
*Destroy a low-level binary tree.*
- **\_gdsl\_bintree\_t \_gdsl\_bintree\_copy** (const **\_gdsl\_bintree\_t** T, const **gdsl\_copy\_func\_t** COPY\_F)  
*Copy a low-level binary tree.*
- **bool \_gdsl\_bintree\_is\_empty** (const **\_gdsl\_bintree\_t** T)  
*Check if a low-level binary tree is empty.*
- **bool \_gdsl\_bintree\_is\_leaf** (const **\_gdsl\_bintree\_t** T)  
*Check if a low-level binary tree is reduced to a leaf.*
- **bool \_gdsl\_bintree\_is\_root** (const **\_gdsl\_bintree\_t** T)  
*Check if a low-level binary tree is a root.*
- **gdsl\_element\_t \_gdsl\_bintree\_get\_content** (const **\_gdsl\_bintree\_t** T)  
*Get the root content of a low-level binary tree.*
- **\_gdsl\_bintree\_t \_gdsl\_bintree\_get\_parent** (const **\_gdsl\_bintree\_t** T)  
*Get the parent tree of a low-level binary tree.*
- **\_gdsl\_bintree\_t \_gdsl\_bintree\_get\_left** (const **\_gdsl\_bintree\_t** T)  
*Get the left sub-tree of a low-level binary tree.*
- **\_gdsl\_bintree\_t \_gdsl\_bintree\_get\_right** (const **\_gdsl\_bintree\_t** T)  
*Get the right sub-tree of a low-level binary tree.*
- **\_gdsl\_bintree\_t\* \_gdsl\_bintree\_get\_left\_ref** (const **\_gdsl\_bintree\_t** T)  
*Get the left sub-tree reference of a low-level binary tree.*
- **\_gdsl\_bintree\_t\* \_gdsl\_bintree\_get\_right\_ref** (const **\_gdsl\_bintree\_t** T)  
*Get the right sub-tree reference of a low-level binary tree.*
- **ulong \_gdsl\_bintree\_get\_height** (const **\_gdsl\_bintree\_t** T)  
*Get the height of a low-level binary tree.*
- **ulong \_gdsl\_bintree\_get\_size** (const **\_gdsl\_bintree\_t** T)  
*Get the size of a low-level binary tree.*
- **void \_gdsl\_bintree\_set\_content** (**\_gdsl\_bintree\_t** T, const **gdsl\_element\_t** E)  
*Set the root element of a low-level binary tree.*
- **void \_gdsl\_bintree\_set\_parent** (**\_gdsl\_bintree\_t** T, const **\_gdsl\_bintree\_t** P)  
*Set the parent tree of a low-level binary tree.*
- **void \_gdsl\_bintree\_set\_left** (**\_gdsl\_bintree\_t** T, const **\_gdsl\_bintree\_t** L)  
*Set left sub-tree of a low-level binary tree.*
- **void \_gdsl\_bintree\_set\_right** (**\_gdsl\_bintree\_t** T, const **\_gdsl\_bintree\_t** R)  
*Set right sub-tree of a low-level binary tree.*
- **\_gdsl\_bintree\_t \_gdsl\_bintree\_rotate\_left** (**\_gdsl\_bintree\_t**\* T)  
*Left rotate a low-level binary tree.*

- **`_gdsl_bintree_t_gdsl_bintree_rotate_right`** (`_gdsl_bintree_t *T`)  
*Right rotate a low-level binary tree.*
- **`_gdsl_bintree_t_gdsl_bintree_rotate_left_right`** (`_gdsl_bintree_t *T`)  
*Left-right rotate a low-level binary tree.*
- **`_gdsl_bintree_t_gdsl_bintree_rotate_right_left`** (`_gdsl_bintree_t *T`)  
*Right-left rotate a low-level binary tree.*
- **`_gdsl_bintree_t_gdsl_bintree_map_prefix`** (`const _gdsl_bintree_t T`, `const _gdsl_bintree_map_func_t MAP_F`, `void *USER_DATA`)  
*Parse a low-level binary tree in prefixed order.*
- **`_gdsl_bintree_t_gdsl_bintree_map_infix`** (`const _gdsl_bintree_t T`, `const _gdsl_bintree_map_func_t MAP_F`, `void *USER_DATA`)  
*Parse a low-level binary tree in infix order.*
- **`_gdsl_bintree_t_gdsl_bintree_map_postfix`** (`const _gdsl_bintree_t T`, `const _gdsl_bintree_map_func_t MAP_F`, `void *USER_DATA`)  
*Parse a low-level binary tree in postfix order.*
- **`void _gdsl_bintree_write`** (`const _gdsl_bintree_t T`, `const _gdsl_bintree_write_func_t WRITE_F`, `FILE *OUTPUT_FILE`, `void *USER_DATA`)  
*Write the content of all nodes of a low-level binary tree to a file.*
- **`void _gdsl_bintree_write_xml`** (`const _gdsl_bintree_t T`, `const _gdsl_bintree_write_func_t WRITE_F`, `FILE *OUTPUT_FILE`, `void *USER_DATA`)  
*Write the content of a low-level binary tree to a file into XML.*
- **`void _gdsl_bintree_dump`** (`const _gdsl_bintree_t T`, `const _gdsl_bintree_write_func_t WRITE_F`, `FILE *OUTPUT_FILE`, `void *USER_DATA`)  
*Dump the internal structure of a low-level binary tree to a file.*

### 4.1.3 Typedef Documentation

#### 4.1.3.1 typedef struct \_gdsl\_bintree\* \_gdsl\_bintree\_t

GDSL low-level binary tree type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 73 of file `_gdsl_bintree.h`.

#### 4.1.3.2 typedef int(\* \_gdsl\_bintree\_map\_func\_t)(const \_gdsl\_bintree\_t TREE, void \*USER\_DATA)

GDSL low-level binary tree map function type.

Parameters

<code>TREE</code>	The low-level binary tree to map.
<code>USER_DATA</code>	The user datas to pass to this function.

**Returns**

GDSL\_MAP\_STOP if the mapping must be stopped.  
 GDSL\_MAP\_CONT if the mapping must be continued.

Definition at line 82 of file `_gdsl_bintree.h`.

4.1.3.3 `typedef void(*_gdsl_bintree_write_func_t)(const _gdsl_bintree_t TREE, FILE *OUTPUT_FILE, void *USER_DATA)`

GDSL low-level binary tree write function type.

**Parameters**

<i>TREE</i>	The low-level binary tree to write.
<i>OUTPUT_FILE</i>	The file where to write TREE.
<i>USER_DATA</i>	The user datas to pass to this function.

Definition at line 92 of file `_gdsl_bintree.h`.

**4.1.4 Function Documentation**

4.1.4.1 `_gdsl_bintree_t _gdsl_bintree_alloc ( const gdsl_element_t E, const _gdsl_bintree_t LEFT, const _gdsl_bintree_t RIGHT )`

Create a new low-level binary tree.

Allocate a new low-level binary tree data structure. Its root content is set to E and its left son (resp. right) is set to LEFT (resp. RIGHT).

**Note**

Complexity:  $O(1)$

**Precondition**

nothing.

**Parameters**

<i>E</i>	The root content of the new low-level binary tree to create.
<i>LEFT</i>	The left sub-tree of the new low-level binary tree to create.
<i>RIGHT</i>	The right sub-tree of the new low-level binary tree to create.

**Returns**

the newly allocated low-level binary tree in case of success.  
 NULL in case of insufficient memory.

**See also**

`_gdsI_bintree_free()` (p. 13)

**Examples:**

`examples/main_llbintree.c`.

#### 4.1.4.2 void `_gdsI_bintree_free( _gdsI_bintree_t T, const gdsI_free_func_t FREE_F )`

Destroy a low-level binary tree.

Flush and destroy the low-level binary tree T. If `FREE_F != NULL`, `FREE_F` function is used to deallocate each T's element. Otherwise nothing is done with T's elements.

**Note**

Complexity:  $O(|T|)$

**Precondition**

nothing.

**Parameters**

<i>T</i>	The low-level binary tree to destroy.
<i>FREE_F</i>	The function used to deallocate T's nodes contents.

**See also**

`_gdsI_bintree_alloc()` (p. 12)

**Examples:**

`examples/main_llbintree.c`.

#### 4.1.4.3 `_gdsI_bintree_t _gdsI_bintree_copy( const _gdsI_bintree_t T, const gdsI_copy_func_t COPY_F )`

Copy a low-level binary tree.

Create and return a copy of the low-level binary tree T using `COPY_F` on each T's element to copy them.

**Note**

Complexity:  $O(|T|)$

**Precondition**

`COPY_F != NULL`

**Parameters**

<code>T</code>	The low-level binary tree to copy.
<code>COPY_F</code>	The function used to copy T's nodes contents.

**Returns**

a copy of T in case of success.  
NULL if `_gdsi_bintree_is_empty(T) == TRUE` or in case of insufficient memory.

**See also**

`_gdsi_bintree_alloc()` (p. 12)  
`_gdsi_bintree_free()` (p. 13)  
`_gdsi_bintree_is_empty()` (p. 14)

**Examples:**

`examples/main_llbintree.c`.

**4.1.4.4 `bool _gdsi_bintree_is_empty( const _gdsi_bintree_t T )`**

Check if a low-level binary tree is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

nothing.

**Parameters**

<code>T</code>	The low-level binary tree to check.
----------------	-------------------------------------

**Returns**

TRUE if the low-level binary tree *T* is empty.  
FALSE if the low-level binary tree *T* is not empty.

**See also**

[\\_gdsI\\_bintree\\_is\\_leaf\(\)](#) (p. 15)

[\\_gdsI\\_bintree\\_is\\_root\(\)](#) (p. 15)

**4.1.4.5 bool \_gdsI\_bintree\_is\_leaf( const \_gdsI\_bintree\_t *T* )**

Check if a low-level binary tree is reduced to a leaf.

**Note**

Complexity:  $O(1)$

**Precondition**

*T* must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<i>T</i>	The low-level binary tree to check.
----------	-------------------------------------

**Returns**

TRUE if the low-level binary tree *T* is a leaf.  
FALSE if the low-level binary tree *T* is not a leaf.

**See also**

[\\_gdsI\\_bintree\\_is\\_empty\(\)](#) (p. 14)

[\\_gdsI\\_bintree\\_is\\_root\(\)](#) (p. 15)

**4.1.4.6 bool \_gdsI\_bintree\_is\_root( const \_gdsI\_bintree\_t *T* )**

Check if a low-level binary tree is a root.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to check.
----------------	-------------------------------------

**Returns**

TRUE if the low-level binary tree T is a root.  
FALSE if the low-level binary tree T is not a root.

**See also**

`_gdsI_bintree_is_empty()` (p. 14)

`_gdsI_bintree_is_leaf()` (p. 15)

**4.1.4.7 `gdsI_element_t gdsI_bintree_get_content( const _gdsI_bintree_t T )`**

Get the root content of a low-level binary tree.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to use.
----------------	-----------------------------------

**Returns**

the root's content of the low-level binary tree T.

**See also**

`_gdsI_bintree_set_content()` (p. 21)

**Examples:**

`examples/main_llbintree.c`.

4.1.4.8 `_gdsI_bintree_t _gdsI_bintree_get_parent( const _gdsI_bintree_t T )`

Get the parent tree of a low-level binary tree.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to use.
----------------	-----------------------------------

**Returns**

the parent of the low-level binary tree T if T isn't a root.  
NULL if the low-level binary tree T is a root (ie. T has no parent).

**See also**

`_gdsI_bintree_is_root()` (p. 15)

`_gdsI_bintree_set_parent()` (p. 21)

4.1.4.9 `_gdsI_bintree_t _gdsI_bintree_get_left( const _gdsI_bintree_t T )`

Get the left sub-tree of a low-level binary tree.

Return the left subtree of the low-level binary tree T (noted  $I(T)$ ).

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to use.
----------------	-----------------------------------

**Returns**

the left sub-tree of the low-level binary tree T if T has a left sub-tree.  
 NULL if the low-level binary tree T has no left sub-tree.

**See also**

[\\_gdsI\\_bintree\\_get\\_right\(\)](#) (p. 18)  
[\\_gdsI\\_bintree\\_set\\_left\(\)](#) (p. 22)  
[\\_gdsI\\_bintree\\_set\\_right\(\)](#) (p. 22)

4.1.4.10 `_gdsI_bintree_t _gdsI_bintree_get_right( const _gdsI_bintree_t T )`

Get the right sub-tree of a low-level binary tree.

Return the right subtree of the low-level binary tree T (noted r(T)).

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`

**Parameters**

<code>T</code>	The low-level binary tree to use.
----------------	-----------------------------------

**Returns**

the right sub-tree of the low-level binary tree T if T has a right sub-tree.  
 NULL if the low-level binary tree T has no right sub-tree.

**See also**

[\\_gdsI\\_bintree\\_get\\_left\(\)](#) (p. 17)  
[\\_gdsI\\_bintree\\_set\\_left\(\)](#) (p. 22)  
[\\_gdsI\\_bintree\\_set\\_right\(\)](#) (p. 22)

4.1.4.11 `_gdsI_bintree_t* _gdsI_bintree_get_left_ref( const _gdsI_bintree_t T )`

Get the left sub-tree reference of a low-level binary tree.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsl_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to use.
----------------	-----------------------------------

**Returns**

the left sub-tree reference of the low-level binary tree T.

**See also**

`_gdsl_bintree_get_right_ref()` (p. 19)

**4.1.4.12 `_gdsl_bintree_t* _gdsl_bintree_get_right_ref( const _gdsl_bintree_t T )`**

Get the right sub-tree reference of a low-level binary tree.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsl_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to use.
----------------	-----------------------------------

**Returns**

the right sub-tree reference of the low-level binary tree T.

**See also**

`_gdsl_bintree_get_left_ref()` (p. 18)

**4.1.4.13 `ulong _gdsl_bintree_get_height( const _gdsl_bintree_t T )`**

Get the height of a low-level binary tree.

Compute the height of the low-level binary tree T (noted  $h(T)$ ).

**Note**

Complexity:  $O(|T|)$

**Precondition**

nothing.

**Parameters**

$T$	The low-level binary tree to use.
-----	-----------------------------------

**Returns**

the height of  $T$ .

**See also**

[\\_gdsI\\_bintree\\_get\\_size\(\)](#) (p. 20)

**4.1.4.14 `ulong _gdsI_bintree_get_size( const _gdsI_bintree_t T )`**

Get the size of a low-level binary tree.

**Note**

Complexity:  $O(|T|)$

**Precondition**

nothing.

**Parameters**

$T$	The low-level binary tree to use.
-----	-----------------------------------

**Returns**

the number of elements of  $T$  (noted  $|T|$ ).

**See also**

[\\_gdsI\\_bintree\\_get\\_height\(\)](#) (p. 19)

4.1.4.15 `void _gdsl_bintree_set_content( _gdsl_bintree_t T, const gdsl_element_t E )`

Set the root element of a low-level binary tree.

Modify the root element of the low-level binary tree T to E.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsl_bintree_t`.

**Parameters**

<i>T</i>	The low-level binary tree to modify.
<i>E</i>	The new T's root content.

**See also**

`_gdsl_bintree_get_content` (p. 16)

4.1.4.16 `void _gdsl_bintree_set_parent( _gdsl_bintree_t T, const _gdsl_bintree_t P )`

Set the parent tree of a low-level binary tree.

Modify the parent of the low-level binary tree T to P.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsl_bintree_t`.

**Parameters**

<i>T</i>	The low-level binary tree to modify.
<i>P</i>	The new T's parent.

**See also**

`_gdsl_bintree_get_parent()` (p. 17)

4.1.4.17 `void _gdsI_bintree_set_left( _gdsI_bintree_t T, const _gdsI_bintree_t L )`

Set left sub-tree of a low-level binary tree.

Modify the left sub-tree of the low-level binary tree T to L.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<i>T</i>	The low-level binary tree to modify.
<i>L</i>	The new T's left sub-tree.

**See also**

[\\_gdsI\\_bintree\\_set\\_right\(\)](#) (p. 22)

[\\_gdsI\\_bintree\\_get\\_left\(\)](#) (p. 17)

[\\_gdsI\\_bintree\\_get\\_right\(\)](#) (p. 18)

4.1.4.18 `void _gdsI_bintree_set_right( _gdsI_bintree_t T, const _gdsI_bintree_t R )`

Set right sub-tree of a low-level binary tree.

Modify the right sub-tree of the low-level binary tree T to R.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a non-empty `_gdsI_bintree_t`.

**Parameters**

<i>T</i>	The low-level binary tree to modify.
<i>R</i>	The new T's right sub-tree.

See also

[\\_gdsl\\_bintree\\_set\\_left\(\)](#) (p. 22)  
[\\_gdsl\\_bintree\\_get\\_left\(\)](#) (p. 17)  
[\\_gdsl\\_bintree\\_get\\_right\(\)](#) (p. 18)

#### 4.1.4.19 `_gdsl_bintree_t_gdsl_bintree_rotate_left( _gdsl_bintree_t * T )`

Left rotate a low-level binary tree.

Do a left rotation of the low-level binary tree T.

Note

Complexity:  $O(1)$

Precondition

T & r(T) must be non-empty `_gdsl_bintree_t`.

Parameters

<code>T</code>	The low-level binary tree to rotate.
----------------	--------------------------------------

Returns

the modified T left-rotated.

See also

[\\_gdsl\\_bintree\\_rotate\\_right\(\)](#) (p. 23)  
[\\_gdsl\\_bintree\\_rotate\\_left\\_right\(\)](#) (p. 24)  
[\\_gdsl\\_bintree\\_rotate\\_right\\_left\(\)](#) (p. 25)

Examples:

`examples/main_llbintree.c`.

#### 4.1.4.20 `_gdsl_bintree_t_gdsl_bintree_rotate_right( _gdsl_bintree_t * T )`

Right rotate a low-level binary tree.

Do a right rotation of the low-level binary tree T.

Note

Complexity:  $O(1)$

**Precondition**

T & l(T) must be non-empty `_gdsI_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to rotate.
----------------	--------------------------------------

**Returns**

the modified T right-rotated.

**See also**

`_gdsI_bintree_rotate_left()` (p. 23)  
`_gdsI_bintree_rotate_left_right()` (p. 24)  
`_gdsI_bintree_rotate_right_left()` (p. 25)

**Examples:**

`examples/main_llbintree.c`.

**4.1.4.21 `_gdsI_bintree_t_gdsI_bintree_rotate_left_right( _gdsI_bintree_t * T )`**

Left-right rotate a low-level binary tree.

Do a double left-right rotation of the low-level binary tree T.

**Note**

Complexity:  $O(1)$

**Precondition**

T & l(T) & r(l(T)) must be non-empty `_gdsI_bintree_t`.

**Parameters**

<code>T</code>	The low-level binary tree to rotate.
----------------	--------------------------------------

**Returns**

the modified T left-right-rotated.

See also

[\\_gdsl\\_bintree\\_rotate\\_left\(\)](#) (p. 23)  
[\\_gdsl\\_bintree\\_rotate\\_right\(\)](#) (p. 23)  
[\\_gdsl\\_bintree\\_rotate\\_right\\_left\(\)](#) (p. 25)

#### 4.1.4.22 `_gdsl_bintree_t_gdsl_bintree_rotate_right_left( _gdsl_bintree_t * T )`

Right-left rotate a low-level binary tree.

Do a double right-left rotation of the low-level binary tree T.

Note

Complexity:  $O(1)$

Precondition

T & r(T) & l(r(T)) must be non-empty `_gdsl_bintree_t`.

Parameters

<code>T</code>	The low-level binary tree to rotate.
----------------	--------------------------------------

Returns

the modified T right-left-rotated.

See also

[\\_gdsl\\_bintree\\_rotate\\_left\(\)](#) (p. 23)  
[\\_gdsl\\_bintree\\_rotate\\_right\(\)](#) (p. 23)  
[\\_gdsl\\_bintree\\_rotate\\_left\\_right\(\)](#) (p. 24)

#### 4.1.4.23 `_gdsl_bintree_t_gdsl_bintree_map_prefix( const _gdsl_bintree_t T, const _gdsl_bintree_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level binary tree in prefixed order.

Parse all nodes of the low-level binary tree T in prefixed order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then [\\_gdsl\\_bintree\\_map\\_prefix\(\)](#) (p. 25) stops and returns its last examined node.

Note

Complexity:  $O(|T|)$

**Precondition**

MAP\_F != NULL

**Parameters**

<i>T</i>	The low-level binary tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
NULL when the parsing is done.

**See also**

[\\_gdsl\\_bintree\\_map\\_infix\(\)](#) (p. 26)  
[\\_gdsl\\_bintree\\_map\\_postfix\(\)](#) (p. 27)

**Examples:**

[examples/main\\_llbintree.c](#).

#### 4.1.4.24 `_gdsl_bintree_t_gdsl_bintree_map_infix( const _gdsl_bintree_t T, const _gdsl_bintree_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level binary tree in infix order.

Parse all nodes of the low-level binary tree T in infix order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then [\\_gdsl\\_bintree\\_map\\_infix\(\)](#) (p. 26) stops and returns its last examined node.

**Note**

Complexity:  $O(|T|)$

**Precondition**

MAP\_F != NULL

**Parameters**

<i>T</i>	The low-level binary tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

[\\_gdsl\\_bintree\\_map\\_prefix\(\)](#) (p. 25)  
[\\_gdsl\\_bintree\\_map\\_postfix\(\)](#) (p. 27)

**Examples:**

[examples/main\\_llbintree.c](#).

4.1.4.25 `_gdsl_bintree_t_gdsl_bintree_map_postfix( const _gdsl_bintree_t T,  
 const _gdsl_bintree_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level binary tree in postfix order.

Parse all nodes of the low-level binary tree T in postfix order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then [\\_gdsl\\_bintree\\_map\\_postfix\(\)](#) (p. 27) stops and returns its last examined node.

**Note**

Complexity:  $O(|T|)$

**Precondition**

MAP\_F != NULL

**Parameters**

<i>T</i>	The low-level binary tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

[\\_gdsl\\_bintree\\_map\\_prefix\(\)](#) (p. 25)  
[\\_gdsl\\_bintree\\_map\\_infix\(\)](#) (p. 26)

Examples:

`examples/main_llbintree.c.`

4.1.4.26 `void _gdsI_bintree_write ( const _gdsI_bintree_t T, const  
_gdsI_bintree_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of all nodes of a low-level binary tree to a file.

Write the nodes contents of the low-level binary tree T to OUTPUT\_FILE, using WRITE\_F function. Additionnal USER\_DATA argument could be passed to WRITE\_F.

Note

Complexity:  $O(|T|)$

Precondition

`WRITE_F != NULL & OUTPUT_FILE != NULL`

Parameters

<code>T</code>	The low-level binary tree to write.
<code>WRITE_F</code>	The write function.
<code>OUTPUT_FILE</code>	The file where to write T's nodes.
<code>USER_DATA</code>	User's datas passed to WRITE_F.

See also

`_gdsI_bintree_write_xml()` (p. 28)

`_gdsI_bintree_dump()` (p. 29)

4.1.4.27 `void _gdsI_bintree_write_xml ( const _gdsI_bintree_t T, const  
_gdsI_bintree_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a low-level binary tree to a file into XML.

Write the nodes contents of the low-level binary tree T to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then uses WRITE\_F function to write T's nodes content to OUTPUT\_FILE. Additionnal USER\_DATA argument could be passed to WRITE\_F.

Note

Complexity:  $O(|T|)$

## Precondition

OUTPUT\_FILE != NULL

## Parameters

<i>T</i>	The low-level binary tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's nodes.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

## See also

[\\_gdsI\\_bintree\\_write\(\)](#) (p. 28)

[\\_gdsI\\_bintree\\_dump\(\)](#) (p. 29)

## Examples:

[examples/main\\_llbintree.c](#).

4.1.4.28 void [\\_gdsI\\_bintree\\_dump](#) ( const [\\_gdsI\\_bintree\\_t](#) T, const [\\_gdsI\\_bintree\\_write\\_func\\_t](#) WRITE\_F, FILE \* OUTPUT\_FILE, void \* USER\_DATA )

Dump the internal structure of a low-level binary tree to a file.

Dump the structure of the low-level binary tree T to OUTPUT\_FILE. If WRITE\_F != NULL, then use WRITE\_F function to write T's nodes contents to OUTPUT\_FILE. - Additionaln USER\_DATA argument could be passed to WRITE\_F.

## Note

Complexity:  $O(|T|)$

## Precondition

OUTPUT\_FILE != NULL

## Parameters

<i>T</i>	The low-level binary tree to dump.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's nodes.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

*Dump the internal structure of a low-level binary search tree to a file.*

### 4.2.3 Typedef Documentation

#### 4.2.3.1 typedef `_gdsl_bintree_t` `_gdsl_bstree_t`

GDSL low-level binary search tree type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 71 of file `_gdsl_bstree.h`.

#### 4.2.3.2 typedef `int(*_gdsl_bstree_map_func_t)(_gdsl_bstree_t TREE, void *USER_DATA)`

GDSL low-level binary search tree map function type.

##### Parameters

<code>TREE</code>	The low-level binary search tree to map.
<code>USER_DATA</code>	The user datas to pass to this function.

##### Returns

`GDSL_MAP_STOP` if the mapping must be stopped.  
`GDSL_MAP_CONT` if the mapping must be continued.

Definition at line 80 of file `_gdsl_bstree.h`.

#### 4.2.3.3 typedef `void(*_gdsl_bstree_write_func_t)(_gdsl_bstree_t TREE, FILE *OUTPUT_FILE, void *USER_DATA)`

GDSL low-level binary search tree write function type.

##### Parameters

<code>TREE</code>	The low-level binary search tree to write.
<code>OUTPUT_FILE</code>	The file where to write <code>TREE</code> .
<code>USER_DATA</code>	The user datas to pass to this function.

Definition at line 90 of file `_gdsl_bstree.h`.

### 4.2.4 Function Documentation

#### 4.2.4.1 `_gdsI_bstree_t _gdsI_bstree_alloc( const gdsI_element_t E )`

Create a new low-level binary search tree.

Allocate a new low-level binary search tree data structure. Its root content is sets to E and its left and right sons are set to NULL.

##### Note

Complexity:  $O( 1 )$

##### Precondition

nothing.

##### Parameters

<code>E</code>	The root content of the new low-level binary search tree to create.
----------------	---

##### Returns

the newly allocated low-level binary search tree in case of success.  
NULL in case of insufficient memory.

##### See also

`_gdsI_bstree_free()` (p. 34)

##### Examples:

`examples/main_llbstree.c`.

#### 4.2.4.2 `void _gdsI_bstree_free( _gdsI_bstree_t T, const gdsI_free_func_t FREE_F )`

Destroy a low-level binary search tree.

Flush and destroy the low-level binary search tree T. If `FREE_F != NULL`, `FREE_F` function is used to deallocate each T's element. Otherwise nothing is done with T's elements.

##### Note

Complexity:  $O( |T| )$

##### Precondition

nothing.

##### Parameters

<i>T</i>	The low-level binary search tree to destroy.
<i>FREE_F</i>	The function used to deallocate T's nodes contents.

See also

[\\_gdsI\\_bstree\\_alloc\(\)](#) (p. 34)

Examples:

[examples/main\\_llbstree.c](#).

#### 4.2.4.3 `_gdsI_bstree_t _gdsI_bstree_copy( const _gdsI_bstree_t T, const gdsI_copy_func_t COPY_F )`

Copy a low-level binary search tree.

Create and return a copy of the low-level binary search tree T using COPY\_F on each T's element to copy them.

Note

Complexity:  $O(|T|)$

Precondition

COPY\_F != NULL.

Parameters

<i>T</i>	The low-level binary search tree to copy.
<i>COPY_F</i>	The function used to copy T's nodes contents.

Returns

a copy of T in case of success.

NULL if `_gdsI_bstree_is_empty(T) == TRUE` or in case of insufficient memory.

See also

[\\_gdsI\\_bstree\\_alloc\(\)](#) (p. 34)

[\\_gdsI\\_bstree\\_free\(\)](#) (p. 34)

[\\_gdsI\\_bstree\\_is\\_empty\(\)](#) (p. 35)

#### 4.2.4.4 `bool _gdsI_bstree_is_empty( const _gdsI_bstree_t T )`

Check if a low-level binary search tree is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

nothing.

**Parameters**

<code>T</code>	The low-level binary search tree to check.
----------------	--

**Returns**

TRUE if the low-level binary search tree `T` is empty.  
FALSE if the low-level binary search tree `T` is not empty.

**See also**

[\\_gdsI\\_bstree\\_is\\_leaf\(\)](#) (p. 36)  
[\\_gdsI\\_bstree\\_is\\_root\(\)](#) (p. 37)

**4.2.4.5 bool \_gdsI\_bstree\_is\_leaf( const \_gdsI\_bstree\_t T )**

Check if a low-level binary search tree is reduced to a leaf.

**Note**

Complexity:  $O(1)$

**Precondition**

`T` must be a non-empty `_gdsI_bstree_t`.

**Parameters**

<code>T</code>	The low-level binary search tree to check.
----------------	--

**Returns**

TRUE if the low-level binary search tree `T` is a leaf.  
FALSE if the low-level binary search tree `T` is not a leaf.

**See also**

[\\_gdsI\\_bstree\\_is\\_empty\(\)](#) (p. 35)  
[\\_gdsI\\_bstree\\_is\\_root\(\)](#) (p. 37)

#### 4.2.4.6 `gdsl_element_t_gdsl_bstree_get_content( const_gdsl_bstree_t T )`

Get the root content of a low-level binary search tree.

##### Note

Complexity:  $O(1)$

##### Precondition

T must be a non-empty `_gdsl_bstree_t`.

##### Parameters

<code>T</code>	The low-level binary search tree to use.
----------------	--

##### Returns

the root's content of the low-level binary search tree T.

##### Examples:

`examples/main_llbstree.c`.

#### 4.2.4.7 `bool_gdsl_bstree_is_root( const_gdsl_bstree_t T )`

Check if a low-level binary search tree is a root.

##### Note

Complexity:  $O(1)$

##### Precondition

T must be a non-empty `_gdsl_bstree_t`.

##### Parameters

<code>T</code>	The low-level binary search tree to check.
----------------	--

##### Returns

TRUE if the low-level binary search tree T is a root.  
FALSE if the low-level binary search tree T is not a root.

See also

[\\_gdsI\\_bstree\\_is\\_empty\(\)](#) (p. 35)

[\\_gdsI\\_bstree\\_is\\_leaf\(\)](#) (p. 36)

#### 4.2.4.8 `_gdsI_bstree_t _gdsI_bstree_get_parent( const _gdsI_bstree_t T )`

Get the parent tree of a low-level binary search tree.

Note

Complexity:  $O(1)$

Precondition

T must be a non-empty `_gdsI_bstree_t`.

Parameters

<code>T</code>	The low-level binary search tree to use.
----------------	--

Returns

the parent of the low-level binary search tree T if T isn't a root.  
NULL if the low-level binary search tree T is a root (ie. T has no parent).

See also

[\\_gdsI\\_bstree\\_is\\_root\(\)](#) (p. 37)

#### 4.2.4.9 `_gdsI_bstree_t _gdsI_bstree_get_left( const _gdsI_bstree_t T )`

Get the left sub-tree of a low-level binary search tree.

Note

Complexity:  $O(1)$

Precondition

T must be a non-empty `_gdsI_bstree_t`.

Parameters

<code>T</code>	The low-level binary search tree to use.
----------------	--

**Returns**

the left sub-tree of the low-level binary search tree  $T$  if  $T$  has a left sub-tree.  
NULL if the low-level binary search tree  $T$  has no left sub-tree.

**See also**

[\\_gdsl\\_bstree\\_get\\_right\(\)](#) (p. 39)

**4.2.4.10 `_gdsl_bstree_t _gdsl_bstree_get_right( const _gdsl_bstree_t T )`**

Get the right sub-tree of a low-level binary search tree.

**Note**

Complexity:  $O(1)$

**Precondition**

$T$  must be a non-empty `_gdsl_bstree_t`.

**Parameters**

$T$	The low-level binary search tree to use.
-----	--

**Returns**

the right sub-tree of the low-level binary search tree  $T$  if  $T$  has a right sub-tree.  
NULL if the low-level binary search tree  $T$  has no right sub-tree.

**See also**

[\\_gdsl\\_bstree\\_get\\_left\(\)](#) (p. 38)

**4.2.4.11 `ulong _gdsl_bstree_get_size( const _gdsl_bstree_t T )`**

Get the size of a low-level binary search tree.

**Note**

Complexity:  $O(|T|)$

**Precondition**

nothing.

## Parameters

<i>T</i>	The low-level binary search tree to compute the size from.
----------	--

## Returns

the number of elements of *T* (noted  $|T|$ ).

## See also

[\\_gdsI\\_bstree\\_get\\_height\(\)](#) (p. 40)

4.2.4.12 `ulong _gdsI_bstree_get_height( const _gdsI_bstree_t T )`

Get the height of a low-level binary search tree.

Compute the height of the low-level binary search tree *T* (noted  $h(T)$ ).

## Note

Complexity:  $O(|T|)$

## Precondition

nothing.

## Parameters

<i>T</i>	The low-level binary search tree to compute the height from.
----------	--

## Returns

the height of *T*.

## See also

[\\_gdsI\\_bstree\\_get\\_size\(\)](#) (p. 39)

4.2.4.13 `_gdsI_bstree_t _gdsI_bstree_insert( _gdsI_bstree_t * T, const gdsI_compare_func_t COMP_F, const gdsI_element_t VALUE, int * RESULT )`

Insert an element into a low-level binary search tree if it's not found or return it.

Search for the first element *E* equal to *VALUE* into the low-level binary search tree *T*, by using *COMP\_F* function to find it. If an element *E* equal to *VALUE* is found, then it's returned. If no element equal to *VALUE* is found, then *E* is inserted and its root returned.

**Note**

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$

**Precondition**

`COMP_F != NULL & RESULT != NULL.`

**Parameters**

<i>T</i>	The reference of the low-level binary search tree to use.
<i>COMP_F</i>	The comparison function to use to compare T's elements with <i>VALUE</i> to find E.
<i>VALUE</i>	The value used to search for the element E.
<i>RESULT</i>	The address where the result code will be stored.

**Returns**

the root containing E and `RESULT = GDSL_INSERTED` if E is inserted.  
 the root containing E and `RESULT = GDSL_ERR_DUPLICATE_ENTRY` if E is not inserted.  
`NULL` and `RESULT = GDSL_ERR_MEM_ALLOC` in case of failure.

**See also**

`_gdsl_bstree_search()` (p. 42)  
`_gdsl_bstree_remove()` (p. 41)

**Examples:**

`examples/main_llbstree.c.`

#### 4.2.4.14 `gdsl_element_t gdsl_bstree_remove( _gdsl_bstree_t * T, const gdsl_compare_func_t COMP_F, const gdsl_element_t VALUE )`

Remove an element from a low-level binary search tree.

Remove from the low-level binary search tree T the first founded element E equal to *VALUE*, by using *COMP\_F* function to compare T's elements. If E is found, it is removed from T.

**Note**

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$   
 The resulting T is modified by examining the left sub-tree from the founded e.

**Precondition**

`COMP_F != NULL.`

## Parameters

<i>T</i>	The reference of the low-level binary search tree to modify.
<i>COMP_F</i>	The comparison function to use to compare <i>T</i> 's elements with <i>VALUE</i> to find the element <i>e</i> to remove.
<i>VALUE</i>	The value that must be used by <i>COMP_F</i> to find the element <i>e</i> to remove.

## Returns

the first founded element equal to *VALUE* in *T*.  
 NULL if no element equal to *VALUE* is found or if *T* is empty.

## See also

`_gdsi_bstree_insert()` (p. 40)  
`_gdsi_bstree_search()` (p. 42)

4.2.4.15 `_gdsi_bstree_t _gdsi_bstree_search( const _gdsi_bstree_t T, const gdsi_compare_func_t COMP_F, const gdsi_element_t VALUE )`

Search for a particular element into a low-level binary search tree.

Search the first element *E* equal to *VALUE* in the low-level binary search tree *T*, by using *COMP\_F* function to find it.

## Note

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$

## Precondition

*COMP\_F* != NULL.

## Parameters

<i>T</i>	The low-level binary search tree to use.
<i>COMP_F</i>	The comparison function to use to compare <i>T</i> 's elements with <i>VALUE</i> to find the element <i>E</i> .
<i>VALUE</i>	The value that must be used by <i>COMP_F</i> to find the element <i>E</i> .

## Returns

the root of the tree containing *E* if it's found.  
 NULL if *VALUE* is not found in *T*.

See also

`_gdsI_bstree_insert()` (p. 40)  
`_gdsI_bstree_remove()` (p. 41)

#### 4.2.4.16 `_gdsI_bstree_t_gdsI_bstree_search_next( const_gdsI_bstree_t T, const_gdsI_compare_func_t COMP_F, const_gdsI_element_t VALUE )`

Search for the next element of a particular element into a low-level binary search tree, according to the binary search tree order.

Search for an element E in the low-level binary search tree T, by using COMP\_F function to find the first element E equal to VALUE.

Note

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$

Precondition

COMP\_F != NULL.

Parameters

<i>T</i>	The low-level binary search tree to use.
<i>COMP_F</i>	The comparison function to use to compare T's elements with VALUE to find the element E.
<i>VALUE</i>	The value that must be used by COMP_F to find the element E.

Returns

the root of the tree containing the successor of E if it's found.  
 NULL if VALUE is not found in T or if E has no successor.

#### 4.2.4.17 `_gdsI_bstree_t_gdsI_bstree_map_prefix( const_gdsI_bstree_t T, const_gdsI_bstree_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level binary search tree in prefixed order.

Parse all nodes of the low-level binary search tree T in prefixed order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns -GDSL\_MAP\_STOP, then `_gdsI_bstree_map_prefix()` (p. 43) stops and returns its last examined node.

Note

Complexity:  $O(|T|)$

**Precondition**

MAP\_F != NULL.

**Parameters**

<i>T</i>	The low-level binary search tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
NULL when the parsing is done.

**See also**

[\\_gdsI\\_bstree\\_map\\_infix\(\)](#) (p. 44)

[\\_gdsI\\_bstree\\_map\\_postfix\(\)](#) (p. 45)

#### 4.2.4.18 `_gdsI_bstree_t_gdsI_bstree_map_infix( const_gdsI_bstree_t T, const_gdsI_bstree_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level binary search tree in infix order.

Parse all nodes of the low-level binary search tree T in infix order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns - GDSL\_MAP\_STOP, then [\\_gdsI\\_bstree\\_map\\_infix\(\)](#) (p. 44) stops and returns its last examined node.

**Note**

Complexity:  $O(|T|)$

**Precondition**

MAP\_F != NULL.

**Parameters**

<i>T</i>	The low-level binary search tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

[\\_gdsl\\_bstree\\_map\\_prefix\(\)](#) (p. 43)  
[\\_gdsl\\_bstree\\_map\\_postfix\(\)](#) (p. 45)

4.2.4.19 `_gdsl_bstree_t_gdsl_bstree_map_postfix( const _gdsl_bstree_t T, const  
 _gdsl_bstree_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level binary search tree in postfix order.

Parse all nodes of the low-level binary search tree T in postfix order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then [\\_gdsl\\_bstree\\_map\\_postfix\(\)](#) (p. 45) stops and returns its last examined node.

**Note**

Complexity:  $O(|T|)$

**Precondition**

MAP\_F != NULL.

**Parameters**

<i>T</i>	The low-level binary search tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

[\\_gdsl\\_bstree\\_map\\_prefix\(\)](#) (p. 43)  
[\\_gdsl\\_bstree\\_map\\_infix\(\)](#) (p. 44)

4.2.4.20 `void _gdsi_bstree_write ( const _gdsi_bstree_t T, const  
_gdsi_bstree_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of all nodes of a low-level binary search tree to a file.

Write the nodes contents of the low-level binary search tree T to OUTPUT\_FILE, using WRITE\_F function. Additionnal USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|T|)$

#### Precondition

WRITE\_F != NULL & OUTPUT\_FILE != NULL.

#### Parameters

<i>T</i>	The low-level binary search tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's nodes.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

#### See also

[\\_gdsi\\_bstree\\_write\\_xml\(\)](#) (p. 46)

[\\_gdsi\\_bstree\\_dump\(\)](#) (p. 47)

4.2.4.21 `void _gdsi_bstree_write_xml ( const _gdsi_bstree_t T, const  
_gdsi_bstree_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a low-level binary search tree to a file into XML.

Write the nodes contents of the low-level binary search tree T to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then use WRITE\_F function to write T's nodes contents to OUTPUT\_FILE. Additionnal USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|T|)$

#### Precondition

OUTPUT\_FILE != NULL.

## Parameters

<i>T</i>	The low-level binary search tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's nodes.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

## See also

[\\_gdsI\\_bstree\\_write\(\)](#) (p. 46)

[\\_gdsI\\_bstree\\_dump\(\)](#) (p. 47)

## Examples:

**examples/main\_llbstree.c.**

```
4.2.4.22 void _gdsI_bstree_dump ( const _gdsI_bstree_t T, const
    _gdsI_bstree_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )
```

Dump the internal structure of a low-level binary search tree to a file.

Dump the structure of the low-level binary search tree T to OUTPUT\_FILE. If WRITE\_F != NULL, then use WRITE\_F function to write T's nodes content to OUTPUT\_FILE. Additional USER\_DATA argument could be passed to WRITE\_F.

## Note

Complexity:  $O(|T|)$

## Precondition

OUTPUT\_FILE != NULL.

## Parameters

<i>T</i>	The low-level binary search tree to dump.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's nodes.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

### 4.3.3 Typedef Documentation

#### 4.3.3.1 typedef `_gdsl_node_t_gdsl_list_t`

GDSL low-level doubly-linked list type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 73 of file `_gdsl_list.h`.

### 4.3.4 Function Documentation

#### 4.3.4.1 `_gdsl_list_t_gdsl_list_alloc( const gdsl_element_t E )`

Create a new low-level list.

Allocate a new low-level list data structure which have only one node. The node's content is set to E.

#### Note

Complexity:  $O(1)$

#### Precondition

nothing.

#### Parameters

<i>E</i>	The content of the first node of the new low-level list to create.
----------	--

**Returns**

the newly allocated low-level list in case of success.  
 NULL in case of insufficient memory.

**See also**

**`_gdsI_list_free()`** (p. 50)

**Examples:**

**`examples/main_llist.c`**.

**4.3.4.2 void `_gdsI_list_free( _gdsI_list_t L, const gdsI_free_func_t FREE_F )`**

Destroy a low-level list.

Flush and destroy the low-level list L. If `FREE_F != NULL`, then the `FREE_F` function is used to deallocated each L's element. Otherwise, nothing is done with L's elements.

**Note**

Complexity:  $O(|L|)$

**Precondition**

nothing.

**Parameters**

<i>L</i>	The low-level list to destroy.
<i>FREE_F</i>	The function used to deallocated L's nodes contents.

**See also**

**`_gdsI_list_alloc()`** (p. 49)

**Examples:**

**`examples/main_llist.c`**.

**4.3.4.3 bool `_gdsI_list_is_empty( const _gdsI_list_t L )`**

Check if a low-level list is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

nothing.

**Parameters**

$L$	The low-level list to check.
-----	------------------------------

**Returns**

TRUE if the low-level list  $L$  is empty.  
FALSE if the low-level list  $L$  is not empty.

**4.3.4.4 `ulong _gdsi_list_get_size( const _gdsi_list_t L )`**

Get the size of a low-level list.

**Note**

Complexity:  $O(|L|)$

**Precondition**

nothing.

**Parameters**

$L$	The low-level list to use.
-----	----------------------------

**Returns**

the number of elements of  $L$  (noted  $|L|$ ).

**Examples:**

**examples/main\_llist.c.**

**4.3.4.5 `void _gdsi_list_link( _gdsi_list_t L1, _gdsi_list_t L2 )`**

Link two low-level lists together.

Link the low-level list  $L2$  after the end of the low-level list  $L1$ . So  $L1$  is before  $L2$ .

**Note**

Complexity:  $O(|L1|)$

**Precondition**

L1 & L2 must be non-empty `_gdsl_list_t`.

**Parameters**

<i>L1</i>	The low-level list to link before L2.
<i>L2</i>	The low-level list to link after L1.

**Examples:**

**examples/main\_llist.c.**

#### 4.3.4.6 `void _gdsl_list_insert_after( _gdsl_list_t L, _gdsl_list_t PREV )`

Insert a low-level list after another one.

Insert the low-level list L after the low-level list PREV.

**Note**

Complexity:  $O(|L|)$

**Precondition**

L & PREV must be non-empty `_gdsl_list_t`.

**Parameters**

<i>L</i>	The low-level list to link after PREV.
<i>PREV</i>	The low-level list that will be linked before L.

**See also**

`_gdsl_list_insert_before()` (p. 52)

`_gdsl_list_remove()` (p. 53)

#### 4.3.4.7 `void _gdsl_list_insert_before( _gdsl_list_t L, _gdsl_list_t SUCC )`

Insert a low-level list before another one.

Insert the low-level list L before the low-level list SUCC.

**Note**

Complexity:  $O(|L|)$

## Precondition

L & SUCC must be non-empty `_gdsl_list_t`.

## Parameters

<i>L</i>	The low-level list to link before SUCC.
<i>SUCC</i>	The low-level list that will be linked after L.

## See also

`_gdsl_list_insert_after()` (p. 52)

`_gdsl_list_remove()` (p. 53)

4.3.4.8 void `_gdsl_list_remove( _gdsl_node_t NODE )`

Remove a node from a low-level list.

Unlink the node `NODE` from the low-level list in which it is inserted.

## Note

Complexity:  $O(1)$

## Precondition

`NODE` must be a non-empty `_gdsl_node_t`.

## Parameters

<i>NODE</i>	The low-level node to unlink from the low-level list in which it's linked.
-------------	--

## See also

`_gdsl_list_insert_after()` (p. 52)

`_gdsl_list_insert_before()` (p. 52)

4.3.4.9 `_gdsl_list_t _gdsl_list_search( _gdsl_list_t L, const _gdsl_compare_func_t COMP_F, void * VALUE )`

Search for a particular node in a low-level list.

Research an element `e` in the low-level list `L`, by using `COMP_F` function to find the first element `e` equal to `VALUE`.

**Note**

Complexity:  $O(|L|)$

**Precondition**

COMP\_F != NULL

**Parameters**

<i>L</i>	The low-level list to use
<i>COMP_F</i>	The comparison function to use to compare L's elements with VALUE to find the element e
<i>VALUE</i>	The value that must be used by COMP_F to find the element e

**Returns**

the sub-list starting by e if it's found.  
 NULL if VALUE is not found in L.

#### 4.3.4.10 `_gdsl_list_t_gdsl_list_map_forward( const_gdsl_list_t L, const_gdsl_node_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level list in forward order.

Parse all nodes of the low-level list L in forward order. The MAP\_F function is called on each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then `_gdsl_list_map_forward()` (p. 54) stops and returns its last examined node.

**Note**

Complexity:  $O(|L|)$

**Precondition**

MAP\_F != NULL.

**Parameters**

<i>L</i>	The low-level list to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas.

**Returns**

the first node for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

See also

`_gdsl_list_map_backward()` (p. 55)

Examples:

`examples/main_llist.c`.

4.3.4.11 `_gdsl_list_t_gdsl_list_map_backward( const_gdsl_list_t L, const_gdsl_node_map_func_t MAP_F, void * USER_DATA )`

Parse a low-level list in backward order.

Parse all nodes of the low-level list `L` in backward order. The `MAP_F` function is called on each node with the `USER_DATA` argument. If `MAP_F` returns `GDSL_MAP_STOP`, then `_gdsl_list_map_backward()` (p. 55) stops and returns its last examined node.

Note

Complexity:  $O(2 |L|)$

Precondition

`L` must be a non-empty `_gdsl_list_t` & `MAP_F` != `NULL`.

Parameters

<code>L</code>	The low-level list to map.
<code>MAP_F</code>	The map function.
<code>USER_DATA</code>	User's datas.

Returns

the first node for which `MAP_F` returns `GDSL_MAP_STOP`.  
`NULL` when the parsing is done.

See also

`_gdsl_list_map_forward()` (p. 54)

Examples:

`examples/main_llist.c`.

4.3.4.12 `void_gdsl_list_write( const_gdsl_list_t L, const_gdsl_node_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write all nodes of a low-level list to a file.

Write the nodes of the low-level list *L* to *OUTPUT\_FILE*, using *WRITE\_F* function. -  
 Additionnal *USER\_DATA* argument could be passed to *WRITE\_F*.

#### Note

Complexity:  $O(|L|)$

#### Precondition

*WRITE\_F* != NULL & *OUTPUT\_FILE* != NULL.

#### Parameters

<i>L</i>	The low-level list to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>L</i> 's nodes.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

#### See also

[\\_gdsI\\_list\\_write\\_xml\(\)](#) (p. 56)

[\\_gdsI\\_list\\_dump\(\)](#) (p. 57)

#### Examples:

**examples/main\_IIlist.c.**

```
4.3.4.13 void _gdsI_list_write_xml( const _gdsI_list_t L, const
    _gdsI_node_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )
```

Write all nodes of a low-level list to a file into XML.

Write the nodes of the low-level list *L* to *OUTPUT\_FILE*, into XML language. If *WRITE\_F* != NULL, then uses *WRITE\_F* function to write *L*'s nodes to *OUTPUT\_FILE*. Additionnal *USER\_DATA* argument could be passed to *WRITE\_F*.

#### Note

Complexity:  $O(|L|)$

#### Precondition

*OUTPUT\_FILE* != NULL.

#### Parameters

<i>L</i>	The low-level list to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write L's nodes.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

`_gdsl_list_write()` (p. 55)  
`_gdsl_list_dump()` (p. 57)

Examples:

`examples/main_llist.c`.

4.3.4.14 `void _gdsl_list_dump( const _gdsl_list_t L, const _gdsl_node_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a low-level list to a file.

Dump the structure of the low-level list *L* to *OUTPUT\_FILE*. If *WRITE\_F* != NULL, then uses *WRITE\_F* function to write L's nodes to *OUTPUT\_FILE*. Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

Note

Complexity:  $O(|L|)$

Precondition

*OUTPUT\_FILE* != NULL.

Parameters

<i>L</i>	The low-level list to dump.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write L's nodes.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

*Dump the internal structure of a low-level node to a file.*

### 4.4.3 Typedef Documentation

#### 4.4.3.1 typedef struct **\_gdsl\_node\*** **\_gdsl\_node\_t**

GDSL low-level doubly linked node type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 69 of file `_gdsl_node.h`.

#### 4.4.3.2 typedef int(\* **\_gdsl\_node\_map\_func\_t**)(const **\_gdsl\_node\_t** NODE, void \*USER\_DATA)

GDSL low-level doubly-linked node map function type.

##### Parameters

<i>NODE</i>	The low-level node to map.
<i>USER_DATA</i>	The user datas to pass to this function.

##### Returns

GDSL\_MAP\_STOP if the mapping must be stopped.  
GDSL\_MAP\_CONT if the mapping must be continued.

Definition at line 78 of file `_gdsl_node.h`.

4.4.3.3 `typedef void(* _gdsI_node_write_func_t)(const _gdsI_node_t NODE, FILE *OUTPUT_FILE, void *USER_DATA)`

GDSL low-level doubly-linked node write function type.

#### Parameters

<i>TREE</i>	The low-level doubly-linked node to write.
<i>OUTPUT_FILE</i>	The file where to write NODE.
<i>USER_DATA</i>	The user datas to pass to this function.

Definition at line 88 of file `_gdsI_node.h`.

### 4.4.4 Function Documentation

#### 4.4.4.1 `_gdsI_node_t _gdsI_node_alloc( void )`

Create a new low-level node.

Allocate a new low-level node data structure.

#### Note

Complexity:  $O(1)$

#### Precondition

nothing.

#### Returns

the newly allocated low-level node in case of success.  
NULL in case of insufficient memory.

#### See also

`_gdsI_node_free()` (p. 61)

#### 4.4.4.2 `gdsI_element_t _gdsI_node_free( _gdsI_node_t NODE )`

Destroy a low-level node.

Deallocate the low-level node NODE.

**Note**

$O(1)$

**Precondition**

`NODE != NULL`

**Returns**

the content of `NODE` (without modification).

**See also**

[\\_gdsI\\_node\\_alloc\(\)](#) (p. 61)

#### 4.4.4.3 `_gdsI_node_t _gdsI_node_get_succ( const _gdsI_node_t NODE )`

Get the successor of a low-level node.

**Note**

Complexity:  $O(1)$

**Precondition**

`NODE != NULL`

**Parameters**

<code>NODE</code>	The low-level node which we want to get the successor from.
-------------------	---

**Returns**

the successor of the low-level node `NODE` if `NODE` has a successor.  
NULL if the low-level node `NODE` has no successor.

**See also**

[\\_gdsI\\_node\\_get\\_pred\(\)](#) (p. 62)

[\\_gdsI\\_node\\_set\\_succ\(\)](#) (p. 64)

[\\_gdsI\\_node\\_set\\_pred\(\)](#) (p. 64)

#### 4.4.4.4 `_gdsI_node_t _gdsI_node_get_pred( const _gdsI_node_t NODE )`

Get the predecessor of a low-level node.

**Note**

Complexity:  $O(1)$

**Precondition**

`NODE != NULL`

**Parameters**

<code>NODE</code>	The low-level node which we want to get the predecessor from.
-------------------	---

**Returns**

the predecessor of the low-level node `NODE` if `NODE` has a predecessor.  
NULL if the low-level node `NODE` has no predecessor.

**See also**

[`\_gdsI\_node\_get\_succ\(\)`](#) (p. 62)

[`\_gdsI\_node\_set\_succ\(\)`](#) (p. 64)

[`\_gdsI\_node\_set\_pred\(\)`](#) (p. 64)

**4.4.4.5 `gdsI_element_t_gdsI_node_get_content( const_gdsI_node_t NODE )`**

Get the content of a low-level node.

**Note**

Complexity:  $O(1)$

**Precondition**

`NODE != NULL`

**Parameters**

<code>NODE</code>	The low-level node which we want to get the content from.
-------------------	---

**Returns**

the content of the low-level node `NODE` if `NODE` has a content.  
NULL if the low-level node `NODE` has no content.

See also

`_gdsI_node_set_content()` (p. 65)

Examples:

`examples/main_llist.c`.

4.4.4.6 `void _gdsI_node_set_succ( _gdsI_node_t NODE, const _gdsI_node_t SUCC )`

Set the successor of a low-level node.

Modify the successor of the low-level node `NODE` to `SUCC`.

Note

Complexity:  $O(1)$

Precondition

`NODE != NULL`

Parameters

<code>NODE</code>	The low-level node which want to change the successor from.
<code>SUCC</code>	The new successor of <code>NODE</code> .

See also

`_gdsI_node_get_succ()` (p. 62)

4.4.4.7 `void _gdsI_node_set_pred( _gdsI_node_t NODE, const _gdsI_node_t PRED )`

Set the predecessor of a low-level node.

Modify the predecessor of the low-level node `NODE` to `PRED`.

Note

Complexity:  $O(1)$

Precondition

`NODE != NULL`

Parameters

<code>NODE</code>	The low-level node which want to change the predecessor from.
<code>PRED</code>	The new predecessor of <code>NODE</code> .

See also

[\\_gdsI\\_node\\_get\\_pred\(\)](#) (p. 62)

4.4.4.8 void `_gdsI_node_set_content( _gdsI_node_t NODE, const gdsI_element_t CONTENT )`

Set the content of a low-level node.

Modify the content of the low-level node `NODE` to `CONTENT`.

Note

Complexity:  $O(1)$

Precondition

`NODE != NULL`

Parameters

<i>NODE</i>	The low-level node which want to change the content from.
<i>CONTENT</i>	The new content of <code>NODE</code> .

See also

[\\_gdsI\\_node\\_get\\_content\(\)](#) (p. 63)

4.4.4.9 void `_gdsI_node_link( _gdsI_node_t NODE1, _gdsI_node_t NODE2 )`

Link two low-level nodes together.

Link the two low-level nodes `NODE1` and `NODE2` together. After the link, `NODE1`'s successor is `NODE2` and `NODE2`'s predecessor is `NODE1`.

Note

Complexity:  $O(1)$

Precondition

`NODE1 != NULL & NODE2 != NULL`

Parameters

<i>NODE1</i>	The first low-level node to link to <code>NODE2</code> .
<i>NODE2</i>	The second low-level node to link from <code>NODE1</code> .

See also

[\\_gdsI\\_node\\_unlink\(\)](#) (p. 66)

4.4.4.10 void `_gdsI_node_unlink( _gdsI_node_t NODE1, _gdsI_node_t NODE2 )`

Unlink two low-level nodes.

Unlink the two low-level nodes NODE1 and NODE2. After the unlink, NODE1's successor is NULL and NODE2's predecessor is NULL.

Note

Complexity:  $O(1)$

Precondition

`NODE1 != NULL & NODE2 != NULL`

Parameters

<code>NODE1</code>	The first low-level node to unlink from NODE2.
<code>NODE2</code>	The second low-level node to unlink from NODE1.

See also

[\\_gdsI\\_node\\_link\(\)](#) (p. 65)

4.4.4.11 void `_gdsI_node_write( const _gdsI_node_t NODE, const _gdsI_node_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write a low-level node to a file.

Write the low-level node NODE to OUTPUT\_FILE, using WRITE\_F function. Additional USER\_DATA argument could be passed to WRITE\_F.

Note

Complexity:  $O(1)$

Precondition

`NODE != NULL & WRITE_F != NULL & OUTPUT_FILE != NULL`

## Parameters

<i>NODE</i>	The low-level node to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_F- ILE</i>	The file where to write NODE.
<i>USER_DAT- A</i>	User's datas passed to WRITE_F.

## See also

[\\_gdsI\\_node\\_write\\_xml\(\)](#) (p. 67)

[\\_gdsI\\_node\\_dump\(\)](#) (p. 68)

4.4.4.12 `void _gdsI_node_write_xml( const _gdsI_node_t NODE, const  
_gdsI_node_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write a low-level node to a file into XML.

Write the low-level node *NODE* to *OUTPUT\_FILE*, into XML language. If *WRITE\_F* != NULL, then uses *WRITE\_F* function to write *NODE* to *OUTPUT\_FILE*. Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

## Note

Complexity:  $O(1)$

## Precondition

*NODE* != NULL & *OUTPUT\_FILE* != NULL

## Parameters

<i>NODE</i>	The low-level node to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_F- ILE</i>	The file where to write NODE.
<i>USER_DAT- A</i>	User's datas passed to WRITE_F.

## See also

[\\_gdsI\\_node\\_write\(\)](#) (p. 66)

[\\_gdsI\\_node\\_dump\(\)](#) (p. 68)

```
4.4.4.13 void _gdsI_node_dump( const _gdsI_node_t NODE, const
    _gdsI_node_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )
```

Dump the internal structure of a low-level node to a file.

Dump the structure of the low-level node `NODE` to `OUTPUT_FILE`. If `WRITE_F` != `NULL`, then uses `WRITE_F` function to write `NODE` to `OUTPUT_FILE`. Additional `USER_DATA` argument could be passed to `WRITE_F`.

#### Note

Complexity:  $O(1)$

#### Precondition

`NODE` != `NULL` & `OUTPUT_FILE` != `NULL`

#### Parameters

<code>NODE</code>	The low-level node to dump.
<code>WRITE_F</code>	The write function.
<code>OUTPUT_FILE</code>	The file where to write <code>NODE</code> .
<code>USER_DATA</code>	User's datas passed to <code>WRITE_F</code> .

#### See also

[\\_gdsI\\_node\\_write\(\)](#) (p. 66)

[\\_gdsI\\_node\\_write\\_xml\(\)](#) (p. 67)

*Dump the internal structure of a 2D array to a file.*

### 4.6.3 Typedef Documentation

#### 4.6.3.1 typedef struct gsdl\_2darray\* gsdl\_2darray\_t

GDSL 2D-array type.

This type is voluntary opaque. Variables of this kind could not be directly used, but by the functions of this module.

Definition at line 69 of file `gsdl_2darray.h`.

### 4.6.4 Function Documentation

#### 4.6.4.1 **gsdl\_2darray\_t** **gsdl\_2darray\_alloc** (**const char \* NAME**, **const ulong R**, **const ulong C**, **const gsdl\_alloc\_func\_t ALLOC\_F**, **const gsdl\_free\_func\_t FREE\_F** )

Create a new 2D-array.

Allocate a new 2D-array data structure with R rows and C columns and its name is set to a copy of NAME. The functions pointers ALLOC\_F and FREE\_F could be used to respectively, alloc and free elements in the 2D-array. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing

#### Note

Complexity:  $O(1)$

#### Precondition

nothing

## Parameters

<i>NAME</i>	The name of the new 2D-array to create
<i>R</i>	The number of rows of the new 2D-array to create
<i>C</i>	The number of columns of the new 2D-array to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in a 2D-array
<i>FREE_F</i>	Function to free element when removing it from a 2D-array

## Returns

the newly allocated 2D-array in case of success.  
 NULL in case of insufficient memory.

## See also

**gdsI\_2darray\_free()** (p. 72)  
**gdsI\_alloc\_func\_t** (p. 243)  
**gdsI\_free\_func\_t** (p. 243)

## 4.6.4.2 void gdsI\_2darray\_free( gdsI\_2darray\_t A )

Destroy a 2D-array.

Flush and destroy the 2D-array A. The **FREE\_F** function passed to **gdsI\_2darray\_alloc()** (p. 71) is used to free elements from A, but no check is done to see if an element was set (ie. != NULL) or not. It's up to you to check if the element to free is NULL or not into the **FREE\_F** function.

## Note

Complexity:  $O(R \times C)$ , where R is A's rows count, and C is A's columns count

## Precondition

A must be a valid gdsI\_2darray\_t

## Parameters

<i>A</i>	The 2D-array to destroy
----------	-------------------------

## See also

**gdsI\_2darray\_alloc()** (p. 71)

## 4.6.4.3 const char\* gdsI\_2darray\_get\_name( const gdsI\_2darray\_t A )

Get the name of a 2D-array.

**Note**

Complexity:  $O(1)$

**Precondition**

A must be a valid `gdsI_2darray_t`

**Postcondition**

The returned string **MUST NOT** be freed.

**Parameters**

A	The 2D-array from which getting the name
---	--

**Returns**

the name of the 2D-array A.

**See also**

**`gdsI_2darray_set_name()`** (p. 75)

**4.6.4.4 `ulong gdsI_2darray_get_rows_number ( const gdsI_2darray_t A )`**

Get the number of rows of a 2D-array.

**Note**

Complexity:  $O(1)$

**Precondition**

A must be a valid `gdsI_2darray_t`

**Parameters**

A	The 2D-array from which getting the rows count
---	--

**Returns**

the number of rows of the 2D-array A.

See also

[gdsI\\_2darray\\_get\\_columns\\_number\(\)](#) (p. 74)

[gdsI\\_2darray\\_get\\_size\(\)](#) (p. 74)

#### 4.6.4.5 `ulong gdsI_2darray_get_columns_number( const gdsI_2darray_t A )`

Get the number of columns of a 2D-array.

Note

Complexity:  $O(1)$

Precondition

A must be a valid `gdsI_2darray_t`

Parameters

A	The 2D-array from which getting the columns count
---	---

Returns

the number of columns of the 2D-array A.

See also

[gdsI\\_2darray\\_get\\_rows\\_number\(\)](#) (p. 73)

[gdsI\\_2darray\\_get\\_size\(\)](#) (p. 74)

#### 4.6.4.6 `ulong gdsI_2darray_get_size( const gdsI_2darray_t A )`

Get the size of a 2D-array.

Note

Complexity:  $O(1)$

Precondition

A must be a valid `gdsI_2darray_t`

Parameters

A	The 2D-array to use.
---	----------------------

**Returns**

the number of elements of A (noted  $|A|$ ).

**See also**

**gdsI\_2darray\_get\_rows\_number()** (p. 73)

**gdsI\_2darray\_get\_columns\_number()** (p. 74)

#### 4.6.4.7 **gdsI\_element\_t gdsI\_2darray\_get\_content( const gdsI\_2darray\_t A, const ulong R, const ulong C )**

Get an element from a 2D-array.

**Note**

Complexity:  $O(1)$

**Precondition**

A must be a valid gdsI\_2darray\_t &  $R \leq \text{gdsI_2darray\_get\_rows\_number}(A)$  &  $C \leq \text{gdsI_2darray\_get\_columns\_number}(A)$

**Parameters**

<i>A</i>	The 2D-array from which getting the element
<i>R</i>	The row index of the element to get
<i>C</i>	The column index of the element to get

**Returns**

the element of the 2D-array A contained in row R and column C.

**See also**

**gdsI\_2darray\_set\_content()** (p. 76)

#### 4.6.4.8 **gdsI\_2darray\_t gdsI\_2darray\_set\_name( gdsI\_2darray\_t A, const char \* NEW\_NAME )**

Set the name of a 2D-array.

Change the previous name of the 2D-array A to a copy of NEW\_NAME.

**Note**

Complexity:  $O(1)$

**Precondition**

A must be a valid `gdsi_2darray_t`

**Parameters**

<i>A</i>	The 2D-array to change the name
<i>NEW_NAME</i>	The new name of A

**Returns**

the modified 2D-array in case of success.  
NULL in case of failure.

**See also**

**`gdsi_2darray_get_name()`** (p. 72)

#### 4.6.4.9 `gdsi_element_t gdsi_2darray_set_content( gdsi_2darray_t A, const ulong R, const ulong C, void * VALUE )`

Modify an element in a 2D-array.

Change the element at row R and column C of the 2D-array A, and returns it. The new element to insert is allocated using the `ALLOC_F` function passed to `gdsi_2darray_create()` applied on `VALUE`. The previous element contained in row R and in column C is NOT deallocated. It's up to you to do it before, if necessary.

**Note**

Complexity:  $O(1)$

**Precondition**

A must be a valid `gdsi_2darray_t` &  $R \leq \text{gdsi\_2darray\_get\_rows\_number}(A)$  &  $C \leq \text{gdsi\_2darray\_get\_columns\_number}(A)$

**Parameters**

<i>A</i>	The 2D-array to modify on element from
<i>R</i>	The row number of the element to modify
<i>C</i>	The column number of the element to modify
<i>VALUE</i>	The user value to use for allocating the new element

**Returns**

the newly allocated element in case of success.  
 NULL in case of insufficient memory.

**See also**

**gdsI\_2darray\_get\_content()** (p. 75)

4.6.4.10 void **gdsI\_2darray\_write**( const **gdsI\_2darray\_t** A, const **gdsI\_write\_func\_t** *WRITE\_F*, FILE \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Write the content of a 2D-array to a file.

Write the elements of the 2D-array A to OUTPUT\_FILE, using WRITE\_F function. -  
 Additionnal USER\_DATA argument could be passed to WRITE\_F.

**Note**

Complexity:  $O(R \times C)$ , where R is A's rows count, and C is A's columns count

**Precondition**

*WRITE\_F* != NULL & *OUTPUT\_FILE* != NULL

**Parameters**

<i>A</i>	The 2D-array to write
<i>WRITE_F</i>	The write function
<i>OUTPUT_FILE</i>	The file where to write A's elements
<i>USER_DATA</i>	User's datas passed to WRITE_F

**See also**

**gdsI\_2darray\_write\_xml()** (p. 77)

**gdsI\_2darray\_dump()** (p. 78)

4.6.4.11 void **gdsI\_2darray\_write\_xml**( const **gdsI\_2darray\_t** A, const **gdsI\_write\_func\_t** *WRITE\_F*, FILE \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Write the content of a 2D array to a file into XML.

Write all A's elements to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then uses WRITE\_F to write A's elements to OUTPUT\_FILE. Additionnal USER\_DATA argument could be passed to WRITE\_F.

**Note**

Complexity:  $O(R \times C)$ , where  $R$  is  $A$ 's rows count, and  $C$  is  $A$ 's columns count

**Precondition**

$A$  must be a valid `gdsl_2darray_t` & `OUTPUT_FILE != NULL`

**Parameters**

$A$	The 2D-array to write
<code>WRITE_F</code>	The write function
<code>OUTPUT_FILE</code>	The file where to write $A$ 's elements
<code>USER_DATA-A</code>	User's datas passed to <code>WRITE_F</code>

**See also**

**`gdsl_2darray_write()`** (p. 77)

**`gdsl_2darray_dump()`** (p. 78)

4.6.4.12 `void gdsl_2darray_dump( const gdsl_2darray_t A, const gdsl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a 2D array to a file.

Dump  $A$ 's structure to `OUTPUT_FILE`. If `WRITE_F != NULL`, then uses `WRITE_F` to write  $A$ 's elements to `OUTPUT_FILE`. Additional `USER_DATA` argument could be passed to `WRITE_F`.

**Note**

Complexity:  $O(R \times C)$ , where  $R$  is  $A$ 's rows count, and  $C$  is  $A$ 's columns count

**Precondition**

$A$  must be a valid `gdsl_2darray_t` & `OUTPUT_FILE != NULL`

**Parameters**

$A$	The 2D-array to dump
<code>WRITE_F</code>	The write function
<code>OUTPUT_FILE</code>	The file where to write $A$ 's elements
<code>USER_DATA-A</code>	User's datas passed to <code>WRITE_F</code>

See also

**gdsI\_2darray\_write()** (p. 77)

**gdsI\_2darray\_write\_xml()** (p. 77)

### 4.7.3 Typedef Documentation

#### 4.7.3.1 typedef struct gdsl\_bstree\* gdsl\_bstree\_t

GDSL binary search tree type.

This type is voluntary opaque. Variables of this kind could not be directly used, but by the functions of this module.

Definition at line 72 of file `gdsl_bstree.h`.

### 4.7.4 Function Documentation

#### 4.7.4.1 **gdsl\_bstree\_t** **gdsl\_bstree\_alloc** ( const char \* NAME, **gdsl\_alloc\_func\_t** ALLOC\_F, **gdsl\_free\_func\_t** FREE\_F, **gdsl\_compare\_func\_t** COMP\_F )

Create a new binary search tree.

Allocate a new binary search tree data structure which name is set to a copy of *NAME*. The function pointers *ALLOC\_F*, *FREE\_F* and *COMP\_F* could be used to respectively alloc, free and compares elements in the tree. These pointers could be set to *NULL* to use the default ones:

- the default *ALLOC\_F* simply returns its argument
- the default *FREE\_F* does nothing
- the default *COMP\_F* always returns 0

#### Note

Complexity:  $O(1)$

#### Precondition

nothing

#### Parameters

<i>NAME</i>	The name of the new binary tree to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in a binary tree
<i>FREE_F</i>	Function to free element when removing it from a binary tree
<i>COMP_F</i>	Function to compare elements into the binary tree

#### Returns

the newly allocated binary search tree in case of success.  
*NULL* in case of insufficient memory.

#### See also

**`gdsI_bstree_free()`** (p. 82)  
**`gdsI_bstree_flush()`** (p. 83)  
**`gdsI_alloc_func_t`** (p. 243)  
**`gdsI_free_func_t`** (p. 243)  
**`gdsI_compare_func_t`** (p. 245)

#### Examples:

**`examples/main_bstree.c`**.

#### 4.7.4.2 void `gdsI_bstree_free ( gdsI_bstree_t T )`

Destroy a binary search tree.

Deallocate all the elements of the binary search tree *T* by calling *T*'s *FREE\_F* function passed to **`gdsI_bstree_alloc()`** (p. 81). The name of *T* is deallocated and *T* is deallocated itself too.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_bstree_t`

**Parameters**

<code>T</code>	The binary search tree to deallocate
----------------	--------------------------------------

**See also**

**`gdsl_bstree_alloc()`** (p. 81)

**`gdsl_bstree_flush()`** (p. 83)

**Examples:**

**`examples/main_bstree.c`**.

**4.7.4.3 void `gdsl_bstree_flush( gsdl_bstree_t T )`**

Flush a binary search tree.

Deallocate all the elements of the binary search tree T by calling T's `FREE_F` function passed to **`gdsl_rbtree_alloc()`** (p. 210). The binary search tree T is not deallocated itself and its name is not modified.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_bstree_t`

**Parameters**

<code>T</code>	The binary search tree to flush
----------------	---------------------------------

**See also**

**`gdsl_bstree_alloc()`** (p. 81)

**`gdsl_bstree_free()`** (p. 82)

**Examples:**

**`examples/main_bstree.c`**.

#### 4.7.4.4 `const char* gdsi_bstree_get_name( const gdsi_bstree_t T )`

Get the name of a binary search tree.

##### Note

Complexity:  $O(1)$

##### Precondition

T must be a valid `gdsi_bstree_t`

##### Postcondition

The returned string **MUST NOT** be freed.

##### Parameters

<i>T</i>	The binary search tree to get the name from
----------	---

##### Returns

the name of the binary search tree T.

##### See also

`gdsi_bstree_set_name` (p. 86) ()

#### 4.7.4.5 `bool gdsi_bstree_is_empty( const gdsi_bstree_t T )`

Check if a binary search tree is empty.

##### Note

Complexity:  $O(1)$

##### Precondition

T must be a valid `gdsi_bstree_t`

##### Parameters

<i>T</i>	The binary search tree to check
----------	---------------------------------

**Returns**

TRUE if the binary search tree  $T$  is empty.  
FALSE if the binary search tree  $T$  is not empty.

**Examples:**

**examples/main\_bstree.c.**

**4.7.4.6 gdsI\_element\_t gdsI\_bstree\_get\_root( const gdsI\_bstree\_t  $T$  )**

Get the root of a binary search tree.

**Note**

Complexity:  $O(1)$

**Precondition**

$T$  must be a valid gdsI\_bstree\_t

**Parameters**

$T$	The binary search tree to get the root element from
-----	---

**Returns**

the element at the root of the binary search tree  $T$ .

**Examples:**

**examples/main\_bstree.c.**

**4.7.4.7 ulong gdsI\_bstree\_get\_size( const gdsI\_bstree\_t  $T$  )**

Get the size of a binary search tree.

**Note**

Complexity:  $O(1)$

**Precondition**

$T$  must be a valid gdsI\_bstree\_t

**Parameters**

<i>T</i>	The binary search tree to get the size from
----------	---

**Returns**

the size of the binary search tree *T* (noted  $|T|$ ).

**See also**

**gdsl\_bstree\_get\_height()** (p. 86)

**Examples:**

**examples/main\_bstree.c.**

#### 4.7.4.8 `ulong gsdl_bstree_get_height( const gsdl_bstree_t T )`

Get the height of a binary search tree.

**Note**

Complexity:  $O( |T| )$

**Precondition**

*T* must be a valid `gsdl_bstree_t`

**Parameters**

<i>T</i>	The binary search tree to compute the height from
----------	---

**Returns**

the height of the binary search tree *T* (noted  $h(T)$ ).

**See also**

**gsdl\_bstree\_get\_size()** (p. 85)

**Examples:**

**examples/main\_bstree.c.**

#### 4.7.4.9 `gsdl_bstree_t gsdl_bstree_set_name( gsdl_bstree_t T, const char * NEW_NAME )`

Set the name of a binary search tree.

Change the previous name of the binary search tree T to a copy of NEW\_NAME.

#### Note

Complexity:  $O(1)$

#### Precondition

T must be a valid `gdsI_bstree_t`

#### Parameters

<i>T</i>	The binary search tree to change the name
<i>NEW_NAME</i>	The new name of T

#### Returns

the modified binary search tree in case of success.  
NULL in case of insufficient memory.

#### See also

**`gdsI_bstree_get_name()`** (p. 84)

#### 4.7.4.10 `gdsI_element_t gdsI_bstree_insert( gdsI_bstree_t T, void * VALUE, int * RESULT )`

Insert an element into a binary search tree if it's not found or return it.

Search for the first element E equal to VALUE into the binary search tree T, by using T's COMP\_F function passed to `gdsI_bstree_alloc` to find it. If E is found, then it's returned. If E isn't found, then a new element E is allocated using T's ALLOC\_F function passed to `gdsI_bstree_alloc` and is inserted and then returned.

#### Note

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$

#### Precondition

T must be a valid `gdsI_bstree_t` & RESULT != NULL

#### Parameters

<i>T</i>	The binary search tree to modify
<i>VALUE</i>	The value used to make the new element to insert into T
<i>RESULT</i>	The address where the result code will be stored.

**Returns**

the element E and RESULT = GDSL\_OK if E is inserted into T.  
 the element E and RESULT = GDSL\_ERR\_DUPLICATE\_ENTRY if E is already present in T.  
 NULL and RESULT = GDSL\_ERR\_MEM\_ALLOC in case of insufficient memory.

**See also**

**gdsl\_bstree\_remove()** (p. 88)

**gdsl\_bstree\_delete()** (p. 89)

**Examples:**

**examples/main\_bstree.c.**

#### 4.7.4.11 **gsdl\_element\_t**gsdl\_bstree\_remove( **gsdl\_bstree\_t** T, void \* *VALUE* )

Remove an element from a binary search tree.

Remove from the binary search tree T the first founded element E equal to VALUE, by using T's COMP\_F function passed to **gsdl\_bstree\_alloc()** (p. 81). If E is found, it is removed from T and then returned.

**Note**

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$   
 The resulting T is modified by examining the left sub-tree from the founded E.

**Precondition**

T must be a valid gsdl\_bstree\_t

**Parameters**

<i>T</i>	The binary search tree to modify
<i>VALUE</i>	The value used to find the element to remove

**Returns**

the first founded element equal to VALUE in T in case is found.  
 NULL in case no element equal to VALUE is found in T.

**See also**

**gsdl\_bstree\_insert()** (p. 87)

**gsdl\_bstree\_delete()** (p. 89)

4.7.4.12 `gdsl_bstree_t` `gdsl_bstree_delete( gdsl_bstree_t T, void * VALUE )`

Delete an element from a binary search tree.

Remove from the binary search tree the first founded element E equal to VALUE, by using T's COMP\_F function passed to `gdsl_bstree_alloc()` (p. 81). If E is found, it is removed from T and E is deallocated using T's FREE\_F function passed to `gdsl_bstree_alloc()` (p. 81), then T is returned.

**Note**

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$   
the resulting T is modified by examining the left sub-tree from the founded E.

**Precondition**

T must be a valid `gdsl_bstree_t`

**Parameters**

<code>T</code>	The binary search tree to remove an element from
<code>VALUE</code>	The value used to find the element to remove

**Returns**

the modified binary search tree after removal of E if E was found.  
NULL if no element equal to VALUE was found.

**See also**

`gdsl_bstree_insert()` (p. 87)  
`gdsl_bstree_remove()` (p. 88)

**Examples:**

`examples/main_bstree.c`.

4.7.4.13 `gdsl_element_t` `gdsl_bstree_search( const gdsl_bstree_t T, gdsl_compare_func_t COMP_F, void * VALUE )`

Search for a particular element into a binary search tree.

Search the first element E equal to VALUE in the binary search tree T, by using COMP\_F function to find it. If COMP\_F == NULL, then the COMP\_F function passed to `gdsl_bstree_alloc()` (p. 81) is used.

**Note**

Complexity:  $O(h(T))$ , where  $\log_2(|T|) \leq h(T) \leq |T|-1$

**Precondition**

T must be a valid `gdsl_bstree_t`

**Parameters**

<i>T</i>	The binary search tree to use.
<i>COMP_F</i>	The comparison function to use to compare T's element with VALUE to find the element E (or NULL to use the default T's COMP_F)
<i>VALUE</i>	The value that must be used by COMP_F to find the element E

**Returns**

the first founded element E equal to VALUE.  
NULL if VALUE is not found in T.

**See also**

**`gdsl_bstree_insert()`** (p. 87)  
**`gdsl_bstree_remove()`** (p. 88)  
**`gdsl_bstree_delete()`** (p. 89)

**Examples:**

**`examples/main_bstree.c`**.

#### 4.7.4.14 `gdsl_element_t gdsl_bstree_map_prefix( const gdsl_bstree_t T, gdsl_map_func_t MAP_F, void * USER_DATA )`

Parse a binary search tree in prefixed order.

Parse all nodes of the binary search tree T in prefixed order. The MAP\_F function is called on the element contained in each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then **`gdsl_bstree_map_prefix()`** (p. 90) stops and returns its last examined element.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_bstree_t` & MAP\_F != NULL

**Parameters**

<i>T</i>	The binary search tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

**gdsl\_bstree\_map\_infix()** (p. 91)  
**gdsl\_bstree\_map\_postfix()** (p. 92)

#### 4.7.4.15 `gdsl_element_t` **gdsl\_bstree\_map\_infix** ( `const gdsl_bstree_t T`, `gdsl_map_func_t MAP_F`, `void * USER_DATA` )

Parse a binary search tree in infix order.

Parse all nodes of the binary search tree T in infix order. The MAP\_F function is called on the element contained in each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then **gdsl\_bstree\_map\_infix()** (p. 91) stops and returns its last examined element.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_bstree_t` & MAP\_F != NULL

**Parameters**

<i>T</i>	The binary search tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

**gdsl\_bstree\_map\_prefix()** (p. 90)  
**gdsl\_bstree\_map\_postfix()** (p. 92)

#### 4.7.4.16 `gdsl_element_t gsdl_bstree_map_postfix( const gsdl_bstree_t T, gsdl_map_func_t MAP_F, void * USER_DATA )`

Parse a binary search tree in postfix order.

Parse all nodes of the binary search tree T in postfix order. The MAP\_F function is called on the element contained in each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then **gsdl\_bstree\_map\_postfix()** (p. 92) stops and returns its last examined element.

##### Note

Complexity:  $O(|T|)$

##### Precondition

T must be a valid `gsdl_bstree_t` & MAP\_F != NULL

##### Parameters

<i>T</i>	The binary search tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

##### Returns

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
NULL when the parsing is done.

##### See also

**gsdl\_bstree\_map\_prefix()** (p. 90)  
**gsdl\_bstree\_map\_infix()** (p. 91)

#### 4.7.4.17 `void gsdl_bstree_write( const gsdl_bstree_t T, gsdl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the element of each node of a binary search tree to a file.

Write the nodes elements of the binary search tree T to OUTPUT\_FILE, using WRITE\_F function. Additionnal USER\_DATA argument could be passed to WRITE\_F.

##### Note

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_bstree_t` & `WRITE_F != NULL` & `OUTPUT_FILE != NULL`

**Parameters**

<i>T</i>	The binary search tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's elements.
<i>USER_DATA</i>	User's datas passed to <code>WRITE_F</code> .

**See also**

**`gdsl_bstree_write_xml()`** (p. 93)

**`gdsl_bstree_dump()`** (p. 94)

**Examples:**

**`examples/main_bstree.c`.**

**4.7.4.18** `void gdsl_bstree_write_xml ( const gdsl_bstree_t T, gdsl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a binary search tree to a file into XML.

Write the nodes elements of the binary search tree T to `OUTPUT_FILE`, into XML language. If `WRITE_F != NULL`, then use `WRITE_F` to write T's nodes elements to `OUTPUT_FILE`. Additional `USER_DATA` argument could be passed to `WRITE_F`.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_bstree_t` & `OUTPUT_FILE != NULL`

**Parameters**

<i>T</i>	The binary search tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write T's elements.
<i>USER_DATA</i>	User's datas passed to <code>WRITE_F</code> .

See also

**gdsl\_bstree\_write()** (p. 92)  
**gdsl\_bstree\_dump()** (p. 94)

Examples:

**examples/main\_bstree.c.**

4.7.4.19 void **gdsl\_bstree\_dump**( const **gdsl\_bstree\_t** *T*, **gdsl\_write\_func\_t** *WRITE\_F*,  
FILE \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Dump the internal structure of a binary search tree to a file.

Dump the structure of the binary search tree *T* to *OUTPUT\_FILE*. If *WRITE\_F* != NULL, then use *WRITE\_F* to write *T*'s nodes elements to *OUTPUT\_FILE*. Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

Note

Complexity:  $O(|T|)$

Precondition

*T* must be a valid **gdsl\_bstree\_t** & *OUTPUT\_FILE* != NULL

Parameters

<i>T</i>	The binary search tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>T</i> 's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

**gdsl\_bstree\_write()** (p. 92)  
**gdsl\_bstree\_write\_xml()** (p. 93)

Examples:

**examples/main\_bstree.c.**

### 4.8.3 Typedef Documentation

#### 4.8.3.1 typedef struct hash\_table\* gdsI\_hash\_t

GDSL hashtable type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 72 of file gdsI\_hash.h.

#### 4.8.3.2 typedef const char\*(\* gdsI\_key\_func\_t)(void \*VALUE)

GDSL hashtable key function type.

##### Postcondition

Returned value must be != "" && != NULL.

##### Parameters

<i>VALUE</i>	The value used to get the key from
--------------	------------------------------------

##### Returns

The key associated to the *VALUE*.

Definition at line 80 of file gdsI\_hash.h.

#### 4.8.3.3 typedef ulong(\* gdsI\_hash\_func\_t)(const char \*KEY)

GDSL hashtable hash function type.

##### Parameters

<i>KEY</i>	the key used to compute the hash code.
------------	--

##### Returns

The hashed value computed from *KEY*.

Definition at line 88 of file gdsI\_hash.h.

### 4.8.4 Function Documentation

#### 4.8.4.1 ulong gdsI\_hash ( const char \* *KEY* )

Computes a hash value from a NULL terminated character string.

This function computes a hash value from the NULL terminated *KEY* string.

##### Note

Complexity:  $O(|key|)$

##### Precondition

*KEY* must be NULL-terminated.

## Parameters

<i>KEY</i>	The NULL terminated string to compute the key from
------------	--

## Returns

the hash code computed from *KEY*.

4.8.4.2 **gdsI\_hash\_t gdsI\_hash\_alloc( const char \* *NAME*, gdsI\_alloc\_func\_t *ALLOC\_F*, gdsI\_free\_func\_t *FREE\_F*, gdsI\_key\_func\_t *KEY\_F*, gdsI\_hash\_func\_t *HASH\_F*, ushort *INITIAL\_ENTRIES\_NB* )**

Create a new hashtable.

Allocate a new hashtable data structure which name is set to a copy of *NAME*. The new hashtable will contain initially *INITIAL\_ENTRIES\_NB* lists. This value could be (only) increased with **gdsI\_hash\_modify()** (p. 107) function. Until this function is called, then all H's lists entries have no size limit. The function pointers *ALLOC\_F* and *FREE\_F* could be used to respectively, alloc and free elements in the hashtable. The *KEY\_F* function must provide a unique key associated to its argument. The *HASH\_F* function must compute a hash code from its argument. These pointers could be set to NULL to use the default ones:

- the default *ALLOC\_F* simply returns its argument
- the default *FREE\_F* does nothing
- the default *KEY\_F* simply returns its argument
- the default *HASH\_F* is **gdsI\_hash()** (p. 97) above

## Note

Complexity:  $O(1)$

## Precondition

nothing.

## Parameters

<i>NAME</i>	The name of the new hashtable to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in the hashtable
<i>FREE_F</i>	Function to free element when deleting it from the hashtable
<i>KEY_F</i>	Function to get the key from an element
<i>HASH_F</i>	Function used to compute the hash value.
<i>INITIAL_ENTRIES_NB</i>	Initial number of entries of the hashtable

**Returns**

the newly allocated hashtable in case of success.  
NULL in case of insufficient memory.

**See also**

**gdsI\_hash\_free()** (p. 99)  
**gdsI\_hash\_flush()** (p. 99)  
**gdsI\_hash\_insert()** (p. 104)  
**gdsI\_hash\_modify()** (p. 107)

**Examples:**

**examples/main\_hash.c.**

**4.8.4.3 void gdsI\_hash\_free( gdsI\_hash\_t H )**

Destroy a hashtable.

Deallocate all the elements of the hashtable H by calling H's FREE\_F function passed to **gdsI\_hash\_alloc()** (p. 98). The name of H is deallocated and H is deallocated itself too.

**Note**

Complexity:  $O(|H|)$

**Precondition**

H must be a valid gdsI\_hash\_t

**Parameters**

<i>H</i>	The hashtable to destroy
----------	--------------------------

**See also**

**gdsI\_hash\_alloc()** (p. 98)  
**gdsI\_hash\_flush()** (p. 99)

**Examples:**

**examples/main\_hash.c.**

**4.8.4.4 void gdsI\_hash\_flush( gdsI\_hash\_t H )**

Flush a hashtable.

Deallocate all the elements of the hashtable *H* by calling *H*'s `FREE_F` function passed to `gdsi_hash_alloc()` (p. 98). *H* is not deallocated itself and *H*'s name is not modified.

**Note**

Complexity:  $O(|H|)$

**Precondition**

*H* must be a valid `gdsi_hash_t`

**Parameters**

<i>H</i>	The hashtable to flush
----------	------------------------

**See also**

`gdsi_hash_alloc()` (p. 98)

`gdsi_hash_free()` (p. 99)

**Examples:**

`examples/main_hash.c`.

**4.8.4.5 `const char* gdsi_hash_get_name( const gdsi_hash_t H )`**

Get the name of a hashtable.

**Note**

Complexity:  $O(1)$

**Precondition**

*H* must be a valid `gdsi_hash_t`

**Postcondition**

The returned string **MUST NOT** be freed.

**Parameters**

<i>H</i>	The hashtable to get the name from
----------	------------------------------------

**Returns**

the name of the hashtable H.

**See also**

**gdsI\_hash\_set\_name()** (p. 104)

**4.8.4.6 ushort gdsI\_hash\_get\_entries\_number( const gdsI\_hash\_t H )**

Get the number of entries of a hashtable.

**Note**

Complexity:  $O(1)$

**Precondition**

H must be a valid gdsI\_hash\_t

**Parameters**

<i>H</i>	The hashtable to use.
----------	-----------------------

**Returns**

the number of lists entries of the hashtable H.

**See also**

**gdsI\_hash\_get\_size()** (p. 102)  
gdsI\_hash\_fill\_factor()

**4.8.4.7 ushort gdsI\_hash\_get\_lists\_max\_size( const gdsI\_hash\_t H )**

Get the max number of elements allowed in each entry of a hashtable.

**Note**

Complexity:  $O(1)$

**Precondition**

H must be a valid gdsI\_hash\_t

**Parameters**

<i>H</i>	The hashtable to use.
----------	-----------------------

**Returns**

0 if no lists max size was set before (ie. no limit for H's entries).  
 the max number of elements for each entry of the hashtable H, if the function **gdsI-hash\_modify()** (p. 107) was used with a NEW\_LISTS\_MAX\_SIZE greather than the actual one.

**See also**

**gdsI\_hash\_fill\_factor()**  
**gdsI\_hash\_get\_entries\_number()** (p. 101)  
**gdsI\_hash\_get\_longest\_list\_size()** (p. 102)  
**gdsI\_hash\_modify()** (p. 107)

#### 4.8.4.8 ushort gdsI\_hash\_get\_longest\_list\_size( const gdsI\_hash\_t H )

Get the number of elements of the longest list entry of a hashtable.

**Note**

Complexity:  $O(L)$ , where  $L = \text{gdsI\_hash\_get\_entries\_number}(H)$

**Precondition**

H must be a valid gdsI\_hash\_t

**Parameters**

<i>H</i>	The hashtable to use.
----------	-----------------------

**Returns**

the number of elements of the longest list entry of the hashtable H.

**See also**

**gdsI\_hash\_get\_size()** (p. 102)  
**gdsI\_hash\_fill\_factor()**  
**gdsI\_hash\_get\_entries\_number()** (p. 101)  
**gdsI\_hash\_get\_lists\_max\_size()** (p. 101)

#### 4.8.4.9 ulong gdsI\_hash\_get\_size( const gdsI\_hash\_t H )

Get the size of a hashtable.

**Note**

Complexity:  $O(L)$ , where  $L = \text{gdsI\_hash\_get\_entries\_number}(H)$

**Precondition**

$H$  must be a valid `gdsI_hash_t`

**Parameters**

$H$	The hashtable to get the size from
-----	------------------------------------

**Returns**

the number of elements of  $H$  (noted  $|H|$ ).

**See also**

**`gdsI_hash_get_entries_number()`** (p. 101)

`gdsI_hash_fill_factor()`

**`gdsI_hash_get_longest_list_size()`** (p. 102)

**4.8.4.10 `double gdsI_hash_get_fill_factor( const gdsI_hash_t H )`**

Get the fill factor of a hashtable.

**Note**

Complexity:  $O(L)$ , where  $L = \text{gdsI\_hash\_get\_entries\_number}(H)$

**Precondition**

$H$  must be a valid `gdsI_hash_t`

**Parameters**

$H$	The hashtable to use
-----	----------------------

**Returns**

The fill factor of  $H$ , computed as  $|H| / L$

**See also**

**`gdsI_hash_get_entries_number()`** (p. 101)

**`gdsI_hash_get_longest_list_size()`** (p. 102)

**`gdsI_hash_get_size()`** (p. 102)

Examples:

**examples/main\_hash.c.**

4.8.4.11 `gdsl_hash_t gsdl_hash_set_name( gsdl_hash_t H, const char * NEW_NAME )`

Set the name of a hashtable.

Change the previous name of the hashtable H to a copy of NEW\_NAME.

Note

Complexity:  $O(1)$

Precondition

H must be a valid `gsdl_hash_t`

Parameters

<i>H</i>	The hashtable to change the name
<i>NEW_NAME</i>	The new name of H

Returns

the modified hashtable in case of success.  
NULL in case of insufficient memory.

See also

**`gsdl_hash_get_name()`** (p. 100)

4.8.4.12 `gsdl_element_t gsdl_hash_insert( gsdl_hash_t H, void * VALUE )`

Insert an element into a hashtable (PUSH).

Allocate a new element E by calling H's ALLOC\_F function on VALUE. The key K of the new element E is computed using KEY\_F called on E. If the value of `gsdl_hash_get_lists_max_size(H)` is not reached, or if it is equal to zero, then the insertion is simple. Otherwise, H is re-organized as follow:

- its actual `gsdl_hash_get_entries_number(H)` (say N) is modified as  $N * 2 + 1$
- its actual `gsdl_hash_get_lists_max_size(H)` (say M) is modified as  $M * 2$  The element E is then inserted into H at the entry computed by `HASH_F( K ) modulo gsdl_hash_get_entries_number(H)`. ALLOC\_F, KEY\_F and HASH\_F are the function pointers passed to **`gsdl_hash_alloc()`** (p. 98).

**Note**

Complexity:  $O(1)$  if `gdsl_hash_get_lists_max_size(H)` is not reached or if it is equal to zero

Complexity:  $O(\text{gdsl\_hash\_modify}(H))$  if `gdsl_hash_get_lists_max_size(H)` is reached, so H needs to grow

**Precondition**

H must be a valid `gdsl_hash_t`

**Parameters**

<i>H</i>	The hashtable to modify
<i>VALUE</i>	The value used to make the new element to insert into H

**Returns**

the inserted element E in case of success.  
NULL in case of insufficient memory.

**See also**

**`gdsl_hash_alloc()`** (p. 98)  
**`gdsl_hash_remove()`** (p. 105)  
**`gdsl_hash_delete()`** (p. 106)  
**`gdsl_hash_get_size()`** (p. 102)  
**`gdsl_hash_get_entries_number()`** (p. 101)  
**`gdsl_hash_modify()`** (p. 107)

**Examples:**

**`examples/main_hash.c`**.

**4.8.4.13 `gdsl_element_t gdsl_hash_remove( gdsl_hash_t H, const char * KEY )`**

Remove an element from a hashtable (POP).

Search into the hashtable H for the first element E equal to KEY. If E is found, it is removed from H and then returned.

**Note**

Complexity:  $O(M)$ , where M is the average size of H's lists

**Precondition**

H must be a valid `gdsl_hash_t`

## Parameters

<i>H</i>	The hashtable to modify
<i>KEY</i>	The key used to find the element to remove

## Returns

the first founded element equal to *KEY* in *H* in case is found.  
 NULL in case no element equal to *KEY* is found in *H*.

## See also

**gdsI\_hash\_insert()** (p. 104)

**gdsI\_hash\_search()** (p. 108)

**gdsI\_hash\_delete()** (p. 106)

## Examples:

**examples/main\_hash.c.**

4.8.4.14 **gdsI\_hash\_t gdsI\_hash\_delete( gdsI\_hash\_t *H*, const char \* *KEY* )**

Delete an element from a hashtable.

Remove from the hashtable *H* the first founded element *E* equal to *KEY*. If *E* is found, it is removed from *H* and *E* is deallocated using *H*'s *FREE\_F* function passed to **gdsI\_hash\_alloc()** (p. 98), then *H* is returned.

## Note

Complexity:  $O(M)$ , where *M* is the average size of *H*'s lists

## Precondition

*H* must be a valid *gdsI\_hash\_t*

## Parameters

<i>H</i>	The hashtable to modify
<i>KEY</i>	The key used to find the element to remove

## Returns

the modified hashtable after removal of *E* if *E* was found.  
 NULL if no element equal to *KEY* was found.

## See also

**gdsI\_hash\_insert()** (p. 104)**gdsI\_hash\_search()** (p. 108)**gdsI\_hash\_remove()** (p. 105)4.8.4.15 **gdsI\_hash\_t gdsI\_hash\_modify( gdsI\_hash\_t H, ushort NEW\_ENTRIES\_NB, ushort NEW\_LISTS\_MAX\_SIZE )**

Increase the dimensions of a hashtable.

The hashtable H is re-organized to have NEW\_ENTRIES\_NB lists entries. Each entry is limited to NEW\_LISTS\_MAX\_SIZE elements. After a call to this function, all insertions into H will make H automatically growing if needed. The grow is needed each time an insertion makes an entry list to reach NEW\_LISTS\_MAX\_SIZE elements. In this case, H will be reorganized automatically by **gdsI\_hash\_insert()** (p. 104).

## Note

Complexity:  $O(|H|)$

## Precondition

H must be a valid gdsI\_hash\_t & NEW\_ENTRIES\_NB > gdsI\_hash\_get\_entries\_number(H) & NEW\_LISTS\_MAX\_SIZE > gdsI\_hash\_get\_lists\_max\_size(H)

## Parameters

<i>H</i>	The hashtable to modify
<i>NEW_ENTRIES_NB</i>	
<i>NEW_LISTS_MAX_SIZE</i>	

## Returns

the modified hashtable H in case of success

NULL in case of failure, or in case NEW\_ENTRIES\_NB ≤ gdsI\_hash\_get\_entries\_number(H) or in case NEW\_LISTS\_MAX\_SIZE ≤ gdsI\_hash\_get\_lists\_max\_size(H) in these cases, H is not modified

## See also

**gdsI\_hash\_insert()** (p. 104)**gdsI\_hash\_get\_entries\_number()** (p. 101)**gdsI\_hash\_get\_fill\_factor()** (p. 103)**gdsI\_hash\_get\_longest\_list\_size()** (p. 102)**gdsI\_hash\_get\_lists\_max\_size()** (p. 101)

#### 4.8.4.16 `gdsI_element_t gdsI_hash_search( const gdsI_hash_t H, const char * KEY )`

Search for a particular element into a hashtable (GET).

Search the first element E equal to KEY in the hashtable H.

##### Note

Complexity:  $O(M)$ , where M is the average size of H's lists

##### Precondition

H must be a valid `gdsI_hash_t`

##### Parameters

<i>H</i>	The hashtable to search the element in
<i>KEY</i>	The key to compare H's elements with

##### Returns

the founded element E if it was found.

NULL in case the searched element E was not found.

##### See also

`gdsI_hash_insert()` (p. 104)

`gdsI_hash_remove()` (p. 105)

`gdsI_hash_delete()` (p. 106)

##### Examples:

`examples/main_hash.c`.

#### 4.8.4.17 `gdsI_element_t gdsI_hash_map( const gdsI_hash_t H, gdsI_map_func_t MAP_F, void * USER_DATA )`

Parse a hashtable.

Parse all elements of the hashtable H. The MAP\_F function is called on each H's element with USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP then `gdsI_hash_map()` (p. 108) stops and returns its last examined element.

##### Note

Complexity:  $O(|H|)$

**Precondition**

H must be a valid `gdsl_hash_t` & `MAP_F` != NULL

**Parameters**

<i>H</i>	The hashtable to map
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to <code>MAP_F</code>

**Returns**

the first element for which `MAP_F` returns `GDSL_MAP_STOP`.  
 NULL when the parsing is done.

4.8.4.18 `void gsdl_hash_write( const gsdl_hash_t H, gsdl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write all the elements of a hashtable to a file.

Write the elements of the hashtable H to `OUTPUT_FILE`, using `WRITE_F` function. -  
 Additional `USER_DATA` argument could be passed to `WRITE_F`.

**Note**

Complexity:  $O(|H|)$

**Precondition**

H must be a valid `gdsl_hash_t` & `OUTPUT_FILE` != NULL & `WRITE_F` != NULL

**Parameters**

<i>H</i>	The hashtable to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write H's elements.
<i>USER_DATA</i>	User's datas passed to <code>WRITE_F</code> .

**See also**

`gsdl_hash_write_xml()` (p. 110)

`gsdl_hash_dump()` (p. 110)

**Examples:**

`examples/main_hash.c`.

4.8.4.19 `void gdsI_hash_write_xml( const gdsI_hash_t H, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a hashtable to a file into XML.

Write the elements of the hashtable H to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then uses WRITE\_F to write H's elements to OUTPUT\_FILE. Additional USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|H|)$

#### Precondition

H must be a valid gdsI\_hash\_t & OUTPUT\_FILE != NULL

#### Parameters

<i>H</i>	The hashtable to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write H's elements.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

#### See also

**gdsI\_hash\_write()** (p. 109)

**gdsI\_hash\_dump()** (p. 110)

#### Examples:

**examples/main\_hash.c.**

4.8.4.20 `void gdsI_hash_dump( const gdsI_hash_t H, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a hashtable to a file.

Dump the structure of the hashtable H to OUTPUT\_FILE. If WRITE\_F != NULL, then uses WRITE\_F to write H's elements to OUTPUT\_FILE. Additional USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|H|)$

**Precondition**

H must be a valid `gdsI_hash_t` & `OUTPUT_FILE` != NULL

**Parameters**

<i>H</i>	The hashtable to write
<i>WRITE_F</i>	The write function
<i>OUTPUT_FILE</i>	The file where to write H's elements
<i>USER_DATA</i>	User's datas passed to <code>WRITE_F</code>

**See also**

**`gdsI_hash_write()`** (p. 109)

**`gdsI_hash_write_xml()`** (p. 110)

**Examples:**

**`examples/main_hash.c`**.

### 4.9.3 Typedef Documentation

#### 4.9.3.1 typedef struct heap\* gdsi\_heap\_t

GDSL heap type.

This type is voluntary opaque. Variables of this kind could not be directly used, but by the functions of this module.

Definition at line 73 of file gdsi\_heap.h.

### 4.9.4 Function Documentation

#### 4.9.4.1 gdsi\_heap\_t gdsi\_heap\_alloc ( const char \* NAME, gdsi\_alloc\_func\_t ALLOC\_F, gdsi\_free\_func\_t FREE\_F, gdsi\_compare\_func\_t COMP\_F )

Create a new heap.

Allocate a new heap data structure which name is set to a copy of NAME. The function pointers ALLOC\_F, FREE\_F and COMP\_F could be used to respectively, alloc, free and compares elements in the heap. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing
- the default COMP\_F always returns 0

**Note**

Complexity:  $O(1)$

**Precondition**

nothing

**Parameters**

<i>NAME</i>	The name of the new heap to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in the heap
<i>FREE_F</i>	Function to free element when removing it from the heap
<i>COMP_F</i>	Function to compare elements into the heap

**Returns**

the newly allocated heap in case of success.  
NULL in case of insufficient memory.

**See also**

**gdsI\_heap\_free()** (p. 114)  
**gdsI\_heap\_flush()** (p. 115)

**Examples:**

**examples/main\_heap.c.**

**4.9.4.2 void gdsI\_heap\_free( gdsI\_heap\_t H )**

Destroy a heap.

Deallocate all the elements of the heap H by calling H's FREE\_F function passed to **gdsI\_heap\_alloc()** (p. 113). The name of H is deallocated and H is deallocated itself too.

**Note**

Complexity:  $O(|H|)$

**Precondition**

H must be a valid gdsI\_heap\_t

**Parameters**

<i>H</i>	The heap to destroy
----------	---------------------

See also

**gdsl\_heap\_alloc()** (p. 113)

**gdsl\_heap\_flush()** (p. 115)

Examples:

**examples/main\_heap.c.**

#### 4.9.4.3 void **gdsl\_heap\_flush**( **gdsl\_heap\_t** *H* )

Flush a heap.

Deallocate all the elements of the heap *H* by calling *H*'s `FREE_F` function passed to **gdsl\_heap\_alloc()** (p. 113). *H* is not deallocated itself and *H*'s name is not modified.

Note

Complexity:  $O(|H|)$

Precondition

*H* must be a valid `gdsl_heap_t`

Parameters

<i>H</i>	The heap to flush
----------	-------------------

See also

**gdsl\_heap\_alloc()** (p. 113)

**gdsl\_heap\_free()** (p. 114)

Examples:

**examples/main\_heap.c.**

#### 4.9.4.4 const char\* **gdsl\_heap\_get\_name**( const **gdsl\_heap\_t** *H* )

Get the name of a heap.

Note

Complexity:  $O(1)$

Precondition

*H* must be a valid `gdsl_heap_t`

**Postcondition**

The returned string MUST NOT be freed.

**Parameters**

<i>H</i>	The heap to get the name from
----------	-------------------------------

**Returns**

the name of the heap *H*.

**See also**

**gdsl\_heap\_set\_name()** (p. 118)

**Examples:**

**examples/main\_heap.c.**

**4.9.4.5 `ulong gsdl_heap_get_size( const gsdl_heap_t H )`**

Get the size of a heap.

**Note**

Complexity:  $O(1)$

**Precondition**

*H* must be a valid `gsdl_heap_t`

**Parameters**

<i>H</i>	The heap to get the size from
----------	-------------------------------

**Returns**

the number of elements of *H* (noted  $|H|$ ).

**4.9.4.6 `gsdl_element_t gsdl_heap_get_top( const gsdl_heap_t H )`**

Get the top of a heap.

**Note**

Complexity:  $O(1)$

**Precondition**

H must be a valid `gdsI_heap_t`

**Parameters**

<i>H</i>	The heap to get the top from
----------	------------------------------

**Returns**

the element contained at the top position of the heap H if H is not empty. The returned element is not removed from H.  
NULL if the heap H is empty.

**See also**

**`gdsI_heap_set_top()`** (p. 118)

**Examples:**

**`examples/main_heap.c`**.

**4.9.4.7 `bool gdsI_heap_is_empty( const gdsI_heap_t H )`**

Check if a heap is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

H must be a valid `gdsI_heap_t`

**Parameters**

<i>H</i>	The heap to check
----------	-------------------

**Returns**

TRUE if the heap *H* is empty.  
 FALSE if the heap *H* is not empty.

**Examples:**

**examples/main\_heap.c.**

#### 4.9.4.8 `gdsl_heap_t` `gsdl_heap_set_name( gsdl_heap_t H, const char * NEW_NAME )`

Set the name of a heap.

Change the previous name of the heap *H* to a copy of *NEW\_NAME*.

**Note**

Complexity:  $O(1)$

**Precondition**

*H* must be a valid `gsdl_heap_t`

**Parameters**

<i>H</i>	The heap to change the name
<i>NEW_NAME</i>	The new name of <i>H</i>

**Returns**

the modified heap in case of success.  
 NULL in case of insufficient memory.

**See also**

**`gsdl_heap_get_name()`** (p. 115)

#### 4.9.4.9 `gsdl_element_t` `gsdl_heap_set_top( gsdl_heap_t H, void * VALUE )`

Substitute the top element of a heap by a lesser one.

Try to replace the top element of a heap by a lesser one.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

H must be a valid `gdsl_heap_t`

**Parameters**

<i>H</i>	The heap to substitute the top element
<i>VALUE</i>	the value to substitute to the top

**Returns**

The old top element value in case *VALUE* is lesser than all other *H* elements.  
NULL in case of *VALUE* is greather or equal to all other *H* elements.

**See also**

**`gdsl_heap_get_top()`** (p. 116)

**Examples:**

**`examples/main_heap.c`**.

**4.9.4.10 `gdsl_element_t` `gdsl_heap_insert( gdsl_heap_t H, void * VALUE )`**

Insert an element into a heap (PUSH).

Allocate a new element *E* by calling *H*'s `ALLOC_F` function on *VALUE*. The element *E* is then inserted into *H* at the good position to ensure *H* is always a heap.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

H must be a valid `gdsl_heap_t`

**Parameters**

<i>H</i>	The heap to modify
<i>VALUE</i>	The value used to make the new element to insert into <i>H</i>

**Returns**

the inserted element *E* in case of success.  
NULL in case of insufficient memory.

## See also

**gdsl\_heap\_alloc()** (p. 113)  
gdsl\_heap\_remove()  
gdsl\_heap\_delete()  
**gdsl\_heap\_get\_size()** (p. 116)

## Examples:

**examples/main\_heap.c.**

**4.9.4.11 gdsl\_element\_t gdsl\_heap\_remove\_top( gdsl\_heap\_t H )**

Remove the top element from a heap (POP).

Remove the top element from the heap H. The element is removed from H and is also returned.

## Note

Complexity:  $O(\log(|H|))$

## Precondition

H must be a valid gdsl\_heap\_t

## Parameters

<i>H</i>	The heap to modify
----------	--------------------

## Returns

the removed top element.  
NULL if the heap is empty.

## See also

**gdsl\_heap\_insert()** (p. 119)  
**gdsl\_heap\_delete\_top()** (p. 120)

**4.9.4.12 gdsl\_heap\_t gdsl\_heap\_delete\_top( gdsl\_heap\_t H )**

Delete the top element from a heap.

Remove the top element from the heap H. The element is removed from H and is also deallocated using H's FREE\_F function passed to **gdsl\_heap\_alloc()** (p. 113), then H is returned.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

H must be a valid `gdsl_heap_t`

**Parameters**

<i>H</i>	The heap to modify
----------	--------------------

**Returns**

the modified heap after removal of top element.  
NULL if heap is empty.

**See also**

**`gdsl_heap_insert()`** (p. 119)  
**`gdsl_heap_remove_top()`** (p. 120)

**Examples:**

**`examples/main_heap.c`**.

4.9.4.13 `gdsl_element_t` `gdsl_heap_map_forward( const gdsl_heap_t H, gdsl_map_func_t MAP_F, void * USER_DATA )`

Parse a heap.

Parse all elements of the heap H. The MAP\_F function is called on each H's element with USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP then `gdsl_heap_map()` stops and returns its last examined element.

**Note**

Complexity:  $O(|H|)$

**Precondition**

H must be a valid `gdsl_heap_t` & MAP\_F != NULL

**Parameters**

<i>H</i>	The heap to map
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**Examples:**

**examples/main\_heap.c.**

4.9.4.14 `void gdsl_heap_write ( const gdsl_heap_t H, gdsl_write_func_t WRITE_F,  
 FILE * OUTPUT_FILE, void * USER_DATA )`

Write all the elements of a heap to a file.

Write the elements of the heap H to OUTPUT\_FILE, using WRITE\_F function. -  
 Additionaln USER\_DATA argument could be passed to WRITE\_F.

**Note**

Complexity:  $O(|H|)$

**Precondition**

H must be a valid gdsl\_heap\_t & OUTPUT\_FILE != NULL & WRITE\_F != NULL

**Parameters**

<i>H</i>	The heap to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write H's elements.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

**See also**

**gdsl\_heap\_write\_xml()** (p. 122)

**gdsl\_heap\_dump()** (p. 123)

4.9.4.15 `void gdsl_heap_write_xml ( const gdsl_heap_t H, gdsl_write_func_t  
 WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a heap to a file into XML.

Write the elements of the heap H to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then uses WRITE\_F to write H's elements to OUTPUT\_FILE. Additionaln USER\_DATA argument could be passed to WRITE\_F.

## Note

Complexity:  $O(|H|)$

## Precondition

H must be a valid `gdsI_heap_t` & `OUTPUT_FILE != NULL`

## Parameters

<i>H</i>	The heap to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write H's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

## See also

**`gdsI_heap_write()`** (p. 122)

**`gdsI_heap_dump()`** (p. 123)

## Examples:

**`examples/main_heap.c`**.

4.9.4.16 `void gdsI_heap_dump ( const gdsI_heap_t H, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a heap to a file.

Dump the structure of the heap H to `OUTPUT_FILE`. If `WRITE_F != NULL`, then uses `WRITE_F` to write H's elements to `OUTPUT_FILE`. Additionnal `USER_DATA` argument could be passed to `WRITE_F`.

## Note

Complexity:  $O(|H|)$

## Precondition

H must be a valid `gdsI_heap_t` & `OUTPUT_FILE != NULL`

## Parameters

<i>H</i>	The heap to write
<i>WRITE_F</i>	The write function
<i>OUTPUT_FILE</i>	The file where to write H's elements
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i>

See also

### 4.10.3 Typedef Documentation

#### 4.10.3.1 typedef struct heap\* gsdl\_interval\_heap\_t

GDSL interval heap type.

This type is voluntary opaque. Variables of this kind couldn't be directly used, but by the functions of this module.

Definition at line 72 of file gsdl\_interval\_heap.h.

#### 4.10.4 Function Documentation

4.10.4.1 `gdsI_interval_heap_t gdsI_interval_heap_alloc ( const char *  
NAME, gdsI_alloc_func_t ALLOC_F, gdsI_free_func_t FREE_F,  
gdsI_compare_func_t COMP_F )`

Create a new interval heap.

Allocate a new interval heap data structure which name is set to a copy of NAME. The function pointers ALLOC\_F, FREE\_F and COMP\_F could be used to respectively, alloc, free and compares elements in the interval heap. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing
- the default COMP\_F always returns 0

##### Note

Complexity:  $O(1)$

##### Precondition

nothing

##### Parameters

<i>NAME</i>	The name of the new interval heap to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in the interval heap
<i>FREE_F</i>	Function to free element when removing it from the interval heap
<i>COMP_F</i>	Function to compare elements into the interval heap

##### Returns

the newly allocated interval heap in case of success.  
NULL in case of insufficient memory.

##### See also

`gdsI_interval_heap_free()` (p. 128)  
`gdsI_interval_heap_flush()` (p. 128)

##### Examples:

`examples/main_interval_heap.c`.

#### 4.10.4.2 void `gdsl_interval_heap_free( gsdl_interval_heap_t H )`

Destroy an interval heap.

Deallocate all the elements of the interval heap `H` by calling `H`'s `FREE_F` function passed to `gsdl_interval_heap_alloc()` (p. 127). The name of `H` is deallocated and `H` is deallocated itself too.

##### Note

Complexity:  $O(|H|)$

##### Precondition

`H` must be a valid `gsdl_interval_heap_t`

##### Parameters

<code>H</code>	The interval heap to destroy
----------------	------------------------------

##### See also

`gsdl_interval_heap_alloc()` (p. 127)

`gsdl_interval_heap_flush()` (p. 128)

##### Examples:

`examples/main_interval_heap.c`.

#### 4.10.4.3 void `gsdl_interval_heap_flush( gsdl_interval_heap_t H )`

Flush an interval heap.

Deallocate all the elements of the interval heap `H` by calling `H`'s `FREE_F` function passed to `gsdl_interval_heap_alloc()` (p. 127). `H` is not deallocated itself and `H`'s name is not modified.

##### Note

Complexity:  $O(|H|)$

##### Precondition

`H` must be a valid `gsdl_interval_heap_t`

##### Parameters

<code>H</code>	The heap to flush
----------------	-------------------

See also

**gdsI\_interval\_heap\_alloc()** (p. 127)

**gdsI\_interval\_heap\_free()** (p. 128)

Examples:

**examples/main\_interval\_heap.c.**

#### 4.10.4.4 `const char* gdsI_interval_heap_get_name( const gdsI_interval_heap_t H )`

Get the name of an interval heap.

Note

Complexity:  $O(1)$

Precondition

H must be a valid `gdsI_interval_heap_t`

Postcondition

The returned string MUST NOT be freed.

Parameters

<i>H</i>	The interval heap to get the name from
----------	--

Returns

the name of the interval heap H.

See also

**gdsI\_interval\_heap\_set\_name()** (p. 131)

#### 4.10.4.5 `ulong gdsI_interval_heap_get_size( const gdsI_interval_heap_t H )`

Get the size of a interval heap.

Note

Complexity:  $O(1)$

**Precondition**

H must be a valid `gdsl_interval_heap_t`

**Parameters**

<i>H</i>	The interval heap to get the size from
----------	--

**Returns**

the number of elements of H (noted  $|H|$ ).

**Examples:**

**examples/main\_interval\_heap.c.**

4.10.4.6 `void gdsI_interval_heap_set_max_size( const gdsI_interval_heap_t H,  
ulong size )`

Set the maximum size of the interval heap.

**Note**

Complexity:  $O(1)$

**Precondition**

H must be a valid `gdsI_interval_heap_t`

**Parameters**

<i>H</i>	The interval heap to get the size from
<i>size</i>	The new maximum size

**Returns**

the number of elements of H (noted  $|H|$ ).

4.10.4.7 `bool gdsI_interval_heap_is_empty( const gdsI_interval_heap_t H )`

Check if an interval heap is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

H must be a valid `gdsI_interval_heap_t`

**Parameters**

<i>H</i>	The interval heap to check
----------	----------------------------

**Returns**

TRUE if the interval heap H is empty.  
FALSE if the interval heap H is not empty.

#### 4.10.4.8 `gdsI_interval_heap_t gdsI_interval_heap_set_name ( gdsI_interval_heap_t H, const char * NEW_NAME )`

Set the name of an interval heap.

Change the previous name of the interval heap H to a copy of NEW\_NAME.

**Note**

Complexity: O( 1 )

**Precondition**

H must be a valid `gdsI_interval_heap_t`

**Parameters**

<i>H</i>	The interval heap to change the name
<i>NEW_NAME</i>	The new name of H

**Returns**

the modified interval heap in case of success.  
NULL in case of insufficient memory.

**See also**

**`gdsI_interval_heap_get_name()`** (p. 129)

#### 4.10.4.9 `gdsI_element_t gdsI_interval_heap_insert ( gdsI_interval_heap_t H, void * VALUE )`

Insert an element into an interval heap (PUSH).

Allocate a new element *E* by calling *H*'s `ALLOC_F` function on `VALUE`. The element *E* is then inserted into *H* at the good position to ensure *H* is always an interval heap.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

*H* must be a valid `gdsl_interval_heap_t`

**Parameters**

<i>H</i>	The interval heap to modify
<i>VALUE</i>	The value used to make the new element to insert into <i>H</i>

**Returns**

the inserted element *E* in case of success.  
 NULL in case of insufficient memory.

**See also**

**`gdsl_interval_heap_alloc()`** (p. 127)  
`gdsl_interval_heap_remove()`  
`gdsl_interval_heap_delete()`  
**`gdsl_interval_heap_get_size()`** (p. 129)

**Examples:**

**`examples/main_interval_heap.c`.**

**4.10.4.10 `gdsl_element_t` `gdsl_interval_heap_remove_max` (`gdsl_interval_heap_t H`)**

Remove the maximum element from an interval heap (POP).

Remove the maximum element from the interval heap *H*. The element is removed from *H* and is also returned.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

*H* must be a valid `gdsl_interval_heap_t`

## Parameters

<i>H</i>	The interval heap to modify
----------	-----------------------------

## Returns

the removed top element.  
NULL if the interval heap is empty.

## See also

**gdsI\_interval\_heap\_insert()** (p. 131)  
**gdsI\_interval\_heap\_delete\_max()** (p. 135)

## Examples:

**examples/main\_interval\_heap.c.**

#### 4.10.4.11 `gdsI_element_t gdsI_interval_heap_remove_min( gdsI_interval_heap_t H )`

Remove the minimum element from an interval heap (POP).

Remove the minimum element from the interval heap *H*. The element is removed from *H* and is also returned.

## Note

Complexity:  $O(\log(|H|))$

## Precondition

*H* must be a valid `gdsI_interval_heap_t`

## Parameters

<i>H</i>	The interval heap to modify
----------	-----------------------------

## Returns

the removed top element.  
NULL if the interval heap is empty.

## See also

**gdsI\_interval\_heap\_insert()** (p. 131)  
**gdsI\_interval\_heap\_delete\_max()** (p. 135)

Examples:

`examples/main_interval_heap.c.`

4.10.4.12 `gdsI_element_t gdsI_interval_heap_get_min ( const  
gdsI_interval_heap_t H )`

Get the minimum element.

Note

Complexity:  $O(1)$

Precondition

H must be a valid `gdsI_interval_heap_t`

Parameters

<i>H</i>	The interval heap to get the size from
----------	--

Returns

The smallest element in H

4.10.4.13 `gdsI_element_t gdsI_interval_heap_get_max ( const  
gdsI_interval_heap_t H )`

Get the maximum element.

Note

Complexity:  $O(1)$

Precondition

H must be a valid `gdsI_interval_heap_t`

Parameters

<i>H</i>	The interval heap to get the size from
----------	--

Returns

The largest element in H

**4.10.4.14 gdsI\_interval\_heap\_t gdsI\_interval\_heap\_delete\_min ( gdsI\_interval\_heap\_t H )**

Delete the minimum element from an interval heap.

Remove the minimum element from the interval heap H. The element is removed from H and is also deallocated using H's FREE\_F function passed to **gdsI\_interval\_heap\_alloc()** (p. 127), then H is returned.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

H must be a valid gdsI\_interval\_heap\_t

**Parameters**

<i>H</i>	The interval heap to modify
----------	-----------------------------

**Returns**

the modified interval heap after removal of top element.  
NULL if interval heap is empty.

**See also**

**gdsI\_interval\_heap\_insert()** (p. 131)  
gdsI\_interval\_heap\_remove\_top()

**4.10.4.15 gdsI\_interval\_heap\_t gdsI\_interval\_heap\_delete\_max ( gdsI\_interval\_heap\_t H )**

Delete the maximum element from an interval heap.

Remove the maximum element from the interval heap H. The element is removed from H and is also deallocated using H's FREE\_F function passed to **gdsI\_interval\_heap\_alloc()** (p. 127), then H is returned.

**Note**

Complexity:  $O(\log(|H|))$

**Precondition**

H must be a valid gdsI\_interval\_heap\_t

## Parameters

<i>H</i>	The interval heap to modify
----------	-----------------------------

## Returns

the modified interval heap after removal of top element.  
 NULL if interval heap is empty.

## See also

**gdsl\_interval\_heap\_insert()** (p. 131)  
 gsdl\_interval\_heap\_remove\_top()

#### 4.10.4.16 **gsdl\_element\_t gsdl\_interval\_heap\_map\_forward** ( const gsdl\_interval\_heap\_t *H*, gsdl\_map\_func\_t *MAP\_F*, void \* *USER\_DATA* )

Parse a interval heap.

Parse all elements of the interval heap *H*. The *MAP\_F* function is called on each *H*'s element with *USER\_DATA* argument. If *MAP\_F* returns *GDSL\_MAP\_STOP* then *gsdl\_interval\_heap\_map()* stops and returns its last examined element.

## Note

Complexity:  $O(|H|)$

## Precondition

*H* must be a valid *gsdl\_interval\_heap\_t* & *MAP\_F* != NULL

## Parameters

<i>H</i>	The interval heap to map
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to <i>MAP_F</i>

## Returns

the first element for which *MAP\_F* returns *GDSL\_MAP\_STOP*.  
 NULL when the parsing is done.

#### 4.10.4.17 **void gsdl\_interval\_heap\_write** ( const *gsdl\_interval\_heap\_t H*, *gsdl\_write\_func\_t WRITE\_F*, FILE \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Write all the elements of an interval heap to a file.

Write the elements of the interval heap *H* to *OUTPUT\_FILE*, using *WRITE\_F* function. Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

**Note**

Complexity:  $O(|H|)$

**Precondition**

*H* must be a valid *gdsI\_interval\_heap\_t* & *OUTPUT\_FILE* != NULL & *WRITE\_F* != NULL

**Parameters**

<i>H</i>	The interval heap to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>H</i> 's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

**See also**

***gdsI\_interval\_heap\_write\_xml()*** (p. 137)

***gdsI\_interval\_heap\_dump()*** (p. 138)

4.10.4.18 `void gdsI_interval_heap_write_xml ( const gdsI_interval_heap_t H,  
gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of an interval heap to a file into XML.

Write the elements of the interval heap *H* to *OUTPUT\_FILE*, into XML language. -  
If *WRITE\_F* != NULL, then uses *WRITE\_F* to write *H*'s elements to *OUTPUT\_FILE*.  
Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

**Note**

Complexity:  $O(|H|)$

**Precondition**

*H* must be a valid *gdsI\_interval\_heap\_t* & *OUTPUT\_FILE* != NULL

**Parameters**

<i>H</i>	The interval heap to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>H</i> 's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

**gdsI\_interval\_heap\_write()** (p. 136)

**gdsI\_interval\_heap\_dump()** (p. 138)

4.10.4.19 void **gdsI\_interval\_heap\_dump** ( const **gdsI\_interval\_heap\_t** *H*,  
**gdsI\_write\_func\_t** *WRITE\_F*, FILE \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Dump the internal structure of an interval heap to a file.

Dump the structure of the interval heap *H* to *OUTPUT\_FILE*. If *WRITE\_F* != NULL, then uses *WRITE\_F* to write *H*'s elements to *OUTPUT\_FILE*. Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

Note

Complexity:  $O(|H|)$

Precondition

*H* must be a valid **gdsI\_interval\_heap\_t** & *OUTPUT\_FILE* != NULL

Parameters

<i>H</i>	The interval heap to write
<i>WRITE_F</i>	The write function
<i>OUTPUT_FILE</i>	The file where to write <i>H</i> 's elements
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i>

See also

**gdsI\_interval\_heap\_write()** (p. 136)

**gdsI\_interval\_heap\_write\_xml()** (p. 137)

## 4.11 Doubly-linked list manipulation module

*Parse a list from head to tail.*
- **gsdl\_element\_t gsdl\_list\_map\_backward** (const gsdl\_list\_t L, gsdl\_map\_func\_t MAP\_F, void \*USER\_DATA)  
*Parse a list from tail to head.*
- void **gsdl\_list\_write** (const gsdl\_list\_t L, gsdl\_write\_func\_t WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*Write all the elements of a list to a file.*
- void **gsdl\_list\_write\_xml** (const gsdl\_list\_t L, gsdl\_write\_func\_t WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)

*Write the content of a list to a file into XML.*

- void **gdsl\_list\_dump** (const **gdsl\_list\_t** L, **gdsl\_write\_func\_t** WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)

*Dump the internal structure of a list to a file.*

- **gdsl\_list\_cursor\_t** **gdsl\_list\_cursor\_alloc** (const **gdsl\_list\_t** L)

*Create a new list cursor.*

- void **gdsl\_list\_cursor\_free** (**gdsl\_list\_cursor\_t** C)

*Destroy a list cursor.*

- void **gdsl\_list\_cursor\_move\_to\_head** (**gdsl\_list\_cursor\_t** C)

*Put a cursor on the head of its list.*

- void **gdsl\_list\_cursor\_move\_to\_tail** (**gdsl\_list\_cursor\_t** C)

*Put a cursor on the tail of its list.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_move\_to\_value** (**gdsl\_list\_cursor\_t** C, **gdsl\_compare\_func\_t** COMP\_F, void \*VALUE)

*Place a cursor on a particular element.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_move\_to\_position** (**gdsl\_list\_cursor\_t** C, **ulong** POS)

*Place a cursor on a element given by its position.*

- void **gdsl\_list\_cursor\_step\_forward** (**gdsl\_list\_cursor\_t** C)

*Move a cursor one step forward of its list.*

- void **gdsl\_list\_cursor\_step\_backward** (**gdsl\_list\_cursor\_t** C)

*Move a cursor one step backward of its list.*

- **bool** **gdsl\_list\_cursor\_is\_on\_head** (const **gdsl\_list\_cursor\_t** C)

*Check if a cursor is on the head of its list.*

- **bool** **gdsl\_list\_cursor\_is\_on\_tail** (const **gdsl\_list\_cursor\_t** C)

*Check if a cursor is on the tail of its list.*

- **bool** **gdsl\_list\_cursor\_has\_succ** (const **gdsl\_list\_cursor\_t** C)

*Check if a cursor has a successor.*

- **bool** **gdsl\_list\_cursor\_has\_pred** (const **gdsl\_list\_cursor\_t** C)

*Check if a cursor has a predecessor.*

- void **gdsl\_list\_cursor\_set\_content** (**gdsl\_list\_cursor\_t** C, **gdsl\_element\_t** E)

*Set the content of the cursor.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_get\_content** (const **gdsl\_list\_cursor\_t** C)

*Get the content of a cursor.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_insert\_after** (**gdsl\_list\_cursor\_t** C, void \*VALUE)

*Insert a new element after a cursor.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_insert\_before** (**gdsl\_list\_cursor\_t** C, void \*VALUE)

*Insert a new element before a cursor.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_remove** (**gdsl\_list\_cursor\_t** C)

*Remove the element under a cursor.*

- **gdsl\_element\_t** **gdsl\_list\_cursor\_remove\_after** (**gdsl\_list\_cursor\_t** C)

*Removec the element after a cursor.*

- **gdsl\_element\_t gdsl\_list\_cursor\_remove\_before** (gdsl\_list\_cursor\_t C)

*Remove the element before a cursor.*

- **gdsl\_list\_cursor\_t gdsl\_list\_cursor\_delete** (gdsl\_list\_cursor\_t C)

*Delete the element under a cursor.*

- **gdsl\_list\_cursor\_t gdsl\_list\_cursor\_delete\_after** (gdsl\_list\_cursor\_t C)

*Delete the element after a cursor.*

- **gdsl\_list\_cursor\_t gdsl\_list\_cursor\_delete\_before** (gdsl\_list\_cursor\_t C)

*Delete the element before the cursor of a list.*

### 4.11.3 Typedef Documentation

#### 4.11.3.1 typedef struct \_gdsl\_list\* gdsl\_list\_t

GDSL doubly-linked list type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 70 of file gdsl\_list.h.

#### 4.11.3.2 typedef struct \_gdsl\_list\_cursor\* gdsl\_list\_cursor\_t

GDSL doubly-linked list cursor type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 78 of file gdsl\_list.h.

### 4.11.4 Function Documentation

#### 4.11.4.1 **gdsl\_list\_t gdsl\_list\_alloc** ( const char \* NAME, gdsl\_alloc\_func\_t ALLOC\_F, gdsl\_free\_func\_t FREE\_F )

Create a new list.

Allocate a new list data structure which name is set to a copy of NAME. The function pointers ALLOC\_F and FREE\_F could be used to respectively, alloc and free elements in the list. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing

Note

Complexity: O( 1 )

**Precondition**

nothing

**Parameters**

<i>NAME</i>	The name of the new list to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in the list
<i>FREE_F</i>	Function to free element when removing it from the list

**Returns**

the newly allocated list in case of success.  
NULL in case of insufficient memory.

**See also**

**gdsI\_list\_free()** (p. 143)  
**gdsI\_list\_flush()** (p. 144)

**Examples:**

**examples/main\_list.c.**

**4.11.4.2 void gdsI\_list\_free ( gdsI\_list\_t L )**

Destroy a list.

Flush and destroy the list L. All the elements of L are freed using L's *FREE\_F* function passed to **gdsI\_list\_alloc()** (p. 142).

**Note**

Complexity:  $O(|L|)$

**Precondition**

L must be a valid *gdsI\_list\_t*

**Parameters**

<i>L</i>	The list to destroy
----------	---------------------

See also

**gdsl\_list\_alloc()** (p. 142)

**gdsl\_list\_flush()** (p. 144)

Examples:

**examples/main\_list.c.**

#### 4.11.4.3 void **gdsl\_list\_flush**( **gdsl\_list\_t** *L* )

Flush a list.

Destroy all the elements of the list *L* by calling *L*'s `FREE_F` function passed to **gdsl\_list\_alloc()** (p. 142). *L* is not deallocated itself and *L*'s name is not modified.

Note

Complexity:  $O(|L|)$

Precondition

*L* must be a valid `gdsl_list_t`

Parameters

<i>L</i>	The list to flush
----------	-------------------

See also

**gdsl\_list\_alloc()** (p. 142)

**gdsl\_list\_free()** (p. 143)

Examples:

**examples/main\_list.c.**

#### 4.11.4.4 const char\* **gdsl\_list\_get\_name**( const **gdsl\_list\_t** *L* )

Get the name of a list.

Note

Complexity:  $O(1)$

Precondition

*L* must be a valid `gdsl_list_t`

**Postcondition**

The returned string MUST NOT be freed.

**Parameters**

$L$	The list to get the name from
-----	-------------------------------

**Returns**

the name of the list  $L$ .

**See also**

**gdsl\_list\_set\_name()** (p. 147)

**Examples:**

**examples/main\_list.c.**

**4.11.4.5 `ulong gsdl_list_get_size( const gsdl_list_t L )`**

Get the size of a list.

**Note**

Complexity:  $O(1)$

**Precondition**

$L$  must be a valid `gsdl_list_t`

**Parameters**

$L$	The list to get the size from
-----	-------------------------------

**Returns**

the number of elements of the list  $L$  (noted  $|L|$ ).

**Examples:**

**examples/main\_list.c.**

**4.11.4.6 `bool gsdl_list_is_empty( const gsdl_list_t L )`**

Check if a list is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<code>L</code>	The list to check
----------------	-------------------

**Returns**

TRUE if the list L is empty.  
FALSE if the list L is not empty.

**Examples:**

**examples/main\_list.c.**

**4.11.4.7 `gdsl_element_t gdsl_list_get_head( const gsdl_list_t L )`**

Get the head of a list.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<code>L</code>	The list to get the head from
----------------	-------------------------------

**Returns**

the element at L's head position if L is not empty. The returned element is not removed from L.  
NULL if the list L is empty.

**See also**

**`gdsl_list_get_tail()`** (p. 147)

4.11.4.8 `gdsl_element_t` `gdsl_list_get_tail( const gsdl_list_t L )`

Get the tail of a list.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gsdl_list_t`

**Parameters**

<code>L</code>	The list to get the tail from
----------------	-------------------------------

**Returns**

the element at L's tail position if L is not empty. The returned element is not removed from L.  
NULL if L is empty.

**See also**

`gsdl_list_get_head()` (p. 146)

4.11.4.9 `gsdl_list_t` `gsdl_list_set_name( gsdl_list_t L, const char * NEW_NAME )`

Set the name of a list.

Changes the previous name of the list L to a copy of `NEW_NAME`.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gsdl_list_t`

**Parameters**

<code>L</code>	The list to change the name
<code>NEW_NAME</code>	The new name of L

**Returns**

the modified list in case of success.  
 NULL in case of failure.

**See also**

**gdsl\_list\_get\_name()** (p. 144)

**4.11.4.10 gdslist\_element\_t gdslist\_insert\_head( gdslist\_t L, void \* VALUE )**

Insert an element at the head of a list.

Allocate a new element E by calling L's ALLOC\_F function on VALUE. ALLOC\_F is the function pointer passed to **gdslist\_alloc()** (p. 142). The new element E is then inserted at the header position of the list L.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid gdslist\_t

**Parameters**

<i>L</i>	The list to insert into
<i>VALUE</i>	The value used to make the new element to insert into L

**Returns**

the inserted element E in case of success.  
 NULL in case of failure.

**See also**

**gdslist\_insert\_tail()** (p. 149)  
**gdslist\_remove\_head()** (p. 149)  
**gdslist\_remove\_tail()** (p. 150)  
**gdslist\_remove()** (p. 151)

**Examples:**

**examples/main\_list.c.**

4.11.4.11 `gdsl_element_t` `gdsl_list_insert_tail( gdsl_list_t L, void * VALUE )`

Insert an element at the tail of a list.

Allocate a new element E by calling L's `ALLOC_F` function on VALUE. `ALLOC_F` is the function pointer passed to `gdsl_list_alloc()` (p. 142). The new element E is then inserted at the footer position of the list L.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<i>L</i>	The list to insert into
<i>VALUE</i>	The value used to make the new element to insert into L

**Returns**

the inserted element E in case of success.  
NULL in case of failure.

**See also**

`gdsl_list_insert_head()` (p. 148)  
`gdsl_list_remove_head()` (p. 149)  
`gdsl_list_remove_tail()` (p. 150)  
`gdsl_list_remove()` (p. 151)

**Examples:**

`examples/main_list.c`.

4.11.4.12 `gdsl_element_t` `gdsl_list_remove_head( gdsl_list_t L )`

Remove the head of a list.

Remove the element at the head of the list L.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<code>L</code>	The list to remove the head from
----------------	----------------------------------

**Returns**

the removed element in case of success.  
NULL in case of L is empty.

**See also**

**`gdsl_list_insert_head()`** (p. 148)  
**`gdsl_list_insert_tail()`** (p. 149)  
**`gdsl_list_remove_tail()`** (p. 150)  
**`gdsl_list_remove()`** (p. 151)

**4.11.4.13 `gdsl_element_t` `gdsl_list_remove_tail( gdsl_list_t L )`**

Remove the tail of a list.

Remove the element at the tail of the list L.

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<code>L</code>	The list to remove the tail from
----------------	----------------------------------

**Returns**

the removed element in case of success.  
NULL in case of L is empty.

**See also**

**`gdsl_list_insert_head()`** (p. 148)  
**`gdsl_list_insert_tail()`** (p. 149)  
**`gdsl_list_remove_head()`** (p. 149)

**gdsI\_list\_remove()** (p. 151)

4.11.4.14 **gdsI\_element\_t gdsI\_list\_remove( gdsI\_list\_t L, gdsI\_compare\_func\_t COMP\_F, const void \* VALUE )**

Remove a particular element from a list.

Search into the list L for the first element E equal to VALUE by using COMP\_F. If E is found, it is removed from L and then returned.

**Note**

Complexity:  $O(|L| / 2)$

**Precondition**

L must be a valid gdsI\_list\_t & COMP\_F != NULL

**Parameters**

<i>L</i>	The list to remove the element from
<i>COMP_F</i>	The comparison function used to find the element to remove
<i>VALUE</i>	The value used to compare the element to remove with

**Returns**

the founded element E if it was found.  
NULL in case the searched element E was not found.

**See also**

**gdsI\_list\_insert\_head()** (p. 148)  
**gdsI\_list\_insert\_tail()** (p. 149)  
**gdsI\_list\_remove\_head()** (p. 149)  
**gdsI\_list\_remove\_tail()** (p. 150)

4.11.4.15 **gdsI\_list\_t gdsI\_list\_delete\_head( gdsI\_list\_t L )**

Delete the head of a list.

Remove the header element from the list L and deallocates it using the FREE\_F function passed to **gdsI\_list\_alloc()** (p. 142).

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<code>L</code>	The list to destroy the head from
----------------	-----------------------------------

**Returns**

the modified list L in case of success.  
NULL if L is empty.

**See also**

**`gdsl_list_alloc()`** (p. 142)  
`gdsl_list_destroy_tail()`  
`gdsl_list_destroy()`

**Examples:**

**`examples/main_list.c`**.

**4.11.4.16 `gdsl_list_t` `gdsl_list_delete_tail( gdsl_list_t L )`**

Delete the tail of a list.

Remove the footer element from the list L and deallocates it using the `FREE_F` function passed to **`gdsl_list_alloc()`** (p. 142).

**Note**

Complexity:  $O(1)$

**Precondition**

L must be a valid `gdsl_list_t`

**Parameters**

<code>L</code>	The list to destroy the tail from
----------------	-----------------------------------

**Returns**

the modified list L in case of success.  
NULL if L is empty.

## See also

**gdsl\_list\_alloc()** (p. 142)  
gdsl\_list\_destroy\_head()  
gdsl\_list\_destroy()

## Examples:

**examples/main\_list.c.**

#### 4.11.4.17 **gdsl\_list\_t**gdsl\_list\_delete( **gdsl\_list\_t** *L*, **gdsl\_compare\_func\_t** *COMP\_F*, const void \* *VALUE* )

Delete a particular element from a list.

Search into the list *L* for the first element *E* equal to *VALUE* by using *COMP\_F*. If *E* is found, it is removed from *L* and deallocated using the *FREE\_F* function passed to **gdsl\_list\_alloc()** (p. 142).

## Note

Complexity:  $O(|L| / 2)$

## Precondition

*L* must be a valid **gdsl\_list\_t** & *COMP\_F* != NULL

## Parameters

<i>L</i>	The list to destroy the element from
<i>COMP_F</i>	The comparison function used to find the element to destroy
<i>VALUE</i>	The value used to compare the element to destroy with

## Returns

the modified list *L* if the element is found.  
NULL if the element to destroy is not found.

## See also

**gdsl\_list\_alloc()** (p. 142)  
gdsl\_list\_destroy\_head()  
gdsl\_list\_destroy\_tail()

## Examples:

**examples/main\_list.c.**

4.11.4.18 **gdsI\_element\_t gdsI\_list\_search** ( const **gdsI\_list\_t** *L*,  
**gdsI\_compare\_func\_t** *COMP\_F*, const void \* *VALUE* )

Search for a particular element into a list.

Search the first element *E* equal to *VALUE* in the list *L*, by using *COMP\_F* to compare all *L*'s element with.

**Note**

Complexity:  $O(|L| / 2)$

**Precondition**

*L* must be a valid **gdsI\_list\_t** & *COMP\_F* != NULL

**Parameters**

<i>L</i>	The list to search the element in
<i>COMP_F</i>	The comparison function used to compare <i>L</i> 's element with <i>VALUE</i>
<i>VALUE</i>	The value to compare <i>L</i> 's element with

**Returns**

the first founded element *E* in case of success.  
 NULL in case the searched element *E* was not found.

**See also**

**gdsI\_list\_search\_by\_position()** (p. 154)  
**gdsI\_list\_search\_max()** (p. 155)  
**gdsI\_list\_search\_min()** (p. 156)

**Examples:**

**examples/main\_list.c.**

4.11.4.19 **gdsI\_element\_t gdsI\_list\_search\_by\_position** ( const **gdsI\_list\_t** *L*, **ulong**  
*POS* )

Search for an element by its position in a list.

**Note**

Complexity:  $O(|L| / 2)$

**Precondition**

L must be a valid `gds_l_list_t` &  $POS > 0$  &  $POS \leq |L|$

**Parameters**

<i>L</i>	The list to search the element in
<i>POS</i>	The position where is the element to search

**Returns**

the element at the POS-th position in the list L.  
NULL if  $POS > |L|$  or  $POS \leq 0$ .

**See also**

**`gds_l_list_search()`** (p. 154)  
**`gds_l_list_search_max()`** (p. 155)  
**`gds_l_list_search_min()`** (p. 156)

**Examples:**

**`examples/main_list.c`**.

**4.11.4.20 `gds_l_element_t gds_l_list_search_max ( const gds_l_list_t L, gds_l_compare_func_t COMP_F )`**

Search for the greatest element of a list.

Search the greatest element of the list L, by using COMP\_F to compare L's elements with.

**Note**

Complexity:  $O(|L|)$

**Precondition**

L must be a valid `gds_l_list_t` & `COMP_F` != NULL

**Parameters**

<i>L</i>	The list to search the element in
<i>COMP_F</i>	The comparison function to use to compare L's element with

**Returns**

the highest element of L, by using COMP\_F function.  
 NULL if L is empty.

**See also**

**gdsI\_list\_search()** (p. 154)  
**gdsI\_list\_search\_by\_position()** (p. 154)  
**gdsI\_list\_search\_min()** (p. 156)

**Examples:**

**examples/main\_list.c.**

#### 4.11.4.21 **gdsI\_element\_t gdsI\_list\_search\_min ( const gdsI\_list\_t L, gdsI\_compare\_func\_t COMP\_F )**

Search for the lowest element of a list.

Search the lowest element of the list L, by using COMP\_F to compare L's elements with.

**Note**

Complexity:  $O(|L|)$

**Precondition**

L must be a valid gdsI\_list\_t & COMP\_F != NULL

**Parameters**

<i>L</i>	The list to search the element in
<i>COMP_F</i>	The comparison function to use to compare L's element with

**Returns**

the lowest element of L, by using COMP\_F function.  
 NULL if L is empty.

**See also**

**gdsI\_list\_search()** (p. 154)  
**gdsI\_list\_search\_by\_position()** (p. 154)  
**gdsI\_list\_search\_max()** (p. 155)

4.11.4.22 `gdsl_list_t gsdl_list_sort( gsdl_list_t L, gsdl_compare_func_t COMP_F )`

Sort a list.

Sort the list L using COMP\_F to order L's elements.

**Note**

Complexity:  $O(|L| * \log(|L|))$

**Precondition**

L must be a valid `gsdl_list_t` & `COMP_F != NULL` & L must not contains elements that are equals

**Parameters**

<code>L</code>	The list to sort
<code>COMP_F</code>	The comparison function used to order L's elements

**Returns**

the sorted list L.

**Examples:**

**examples/main\_list.c.**

4.11.4.23 `gsdl_element_t gsdl_list_map_forward( const gsdl_list_t L, gsdl_map_func_t MAP_F, void * USER_DATA )`

Parse a list from head to tail.

Parse all elements of the list L from head to tail. The MAP\_F function is called on each L's element with USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then **gsdl\_list\_map\_forward()** (p. 157) stops and returns its last examined element.

**Note**

Complexity:  $O(|L|)$

**Precondition**

L must be a valid `gsdl_list_t` & `MAP_F != NULL`

**Parameters**

<code>L</code>	The list to parse
<code>MAP_F</code>	The map function to apply on each L's element
<code>USER_DATA</code>	User's datas passed to MAP_F
Generated on Mon Sep 25 2017 18:08:14 for gsdl by Doxygen	

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

**gdsl\_list\_map\_backward()** (p. 158)

#### 4.11.4.24 **gdsl\_element\_t** **gdsl\_list\_map\_backward**( const **gdsl\_list\_t** L, **gdsl\_map\_func\_t** MAP\_F, void \* *USER\_DATA* )

Parse a list from tail to head.

Parse all elements of the list L from tail to head. The MAP\_F function is called on each L's element with USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP then **gdsl\_list\_map\_backward()** (p. 158) stops and returns its last examined element.

**Note**

Complexity:  $O(|L|)$

**Precondition**

L must be a valid **gdsl\_list\_t** & MAP\_F != NULL

**Parameters**

<i>L</i>	The list to parse
<i>MAP_F</i>	The map function to apply on each L's element
<i>USER_DATA</i>	User's datas passed to MAP_F

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

**gdsl\_list\_map\_forward()** (p. 157)

**Examples:**

**examples/main\_list.c.**

4.11.4.25 `void gdsI_list_write( const gdsI_list_t L, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write all the elements of a list to a file.

Write the elements of the list L to OUTPUT\_FILE, using WRITE\_F function. Additionnal USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|L|)$

#### Precondition

L must be a valid gdsI\_list\_t & OUTPUT\_FILE != NULL & WRITE\_F != NULL

#### Parameters

<i>L</i>	The list to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write L's elements.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

#### See also

**gdsI\_list\_write\_xml()** (p. 159)

**gdsI\_list\_dump()** (p. 160)

4.11.4.26 `void gdsI_list_write_xml( const gdsI_list_t L, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a list to a file into XML.

Write the elements of the list L to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then uses WRITE\_F to write L's elements to OUTPUT\_FILE. Additionnal USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|L|)$

#### Precondition

L must be a valid gdsI\_list\_t & OUTPUT\_FILE != NULL

#### Parameters

<i>L</i>	The list to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write L's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

**gdsi\_list\_write()** (p. 159)

**gdsi\_list\_dump()** (p. 160)

Examples:

**examples/main\_list.c.**

4.11.4.27 `void gdsi_list_dump( const gdsi_list_t L, gdsi_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a list to a file.

Dump the structure of the list *L* to *OUTPUT\_FILE*. If *WRITE\_F* != NULL, then uses *WRITE\_F* to write L's elements to *OUTPUT\_FILE*. Additionnal *USER\_DATA* argument could be passed to *WRITE\_F*.

Note

Complexity:  $O(|L|)$

Precondition

*L* must be a valid *gdsi\_list\_t* & *OUTPUT\_FILE* != NULL

Parameters

<i>L</i>	The list to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write L's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

**gdsI\_list\_write()** (p. 159)

**gdsI\_list\_write\_xml()** (p. 159)

Examples:

**examples/main\_list.c.**

#### 4.11.4.28 **gdsI\_list\_cursor\_t gdsI\_list\_cursor\_alloc( const gdsI\_list\_t L )**

Create a new list cursor.

Note

Complexity:  $O(1)$

Precondition

L must be a valid gdsI\_list\_t

Parameters

L	The list on which the cursor is positioned.
---	---

Returns

the newly allocated list cursor in case of success.  
NULL in case of insufficient memory.

See also

**gdsI\_list\_cursor\_free()** (p. 161)

Examples:

**examples/main\_list.c.**

#### 4.11.4.29 **void gdsI\_list\_cursor\_free( gdsI\_list\_cursor\_t C )**

Destroy a list cursor.

Note

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`.

**Parameters**

C	The list cursor to destroy.
---	-----------------------------

**See also**

**`gdsl_list_cursor_alloc()`** (p. 161)

**Examples:**

**`examples/main_list.c`.**

**4.11.4.30 void `gdsl_list_cursor_move_to_head( gsdl_list_cursor_t C )`**

Put a cursor on the head of its list.

Put the cursor C on the head of C's list. Does nothing if C's list is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to use
---	-------------------

**See also**

**`gdsl_list_cursor_move_to_tail()`** (p. 162)

**Examples:**

**`examples/main_list.c`.**

**4.11.4.31 void `gdsl_list_cursor_move_to_tail( gsdl_list_cursor_t C )`**

Put a cursor on the tail of its list.

Put the cursor C on the tail of C's list. Does nothing if C's list is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsI_list_cursor_t`

**Parameters**

<code>C</code>	The cursor to use
----------------	-------------------

**See also**

**`gdsI_list_cursor_move_to_head()`** (p. 162)

4.11.4.32 **`gdsI_element_t gdsI_list_cursor_move_to_value( gdsI_list_cursor_t C, gdsI_compare_func_t COMP_F, void * VALUE )`**

Place a cursor on a particular element.

Search a particular element E in the cursor's list L by comparing all list's elements to VALUE, by using COMP\_F. If E is found, C is positioned on it.

**Note**

Complexity:  $O(|L| / 2)$

**Precondition**

C must be a valid `gdsI_list_cursor_t` & `COMP_F != NULL`

**Parameters**

<code>C</code>	The cursor to put on the element E
<code>COMP_F</code>	The comparison function to search for E
<code>VALUE</code>	The value used to compare list's elements with

**Returns**

the first founded element E in case it exists.  
 NULL in case of element E is not found.

See also

**gdsI\_list\_cursor\_move\_to\_position()** (p. 164)

Examples:

**examples/main\_list.c.**

#### 4.11.4.33 **gdsI\_element\_t gdsI\_list\_cursor\_move\_to\_position( gdsI\_list\_cursor\_t C, ulong POS )**

Place a cursor on a element given by its position.

Search for the POS-th element in the cursor's list L. In case this element exists, the cursor C is positionned on it.

Note

Complexity:  $O(|L| / 2)$

Precondition

C must be a valid gdsI\_list\_cursor\_t &  $POS > 0$  &  $POS \leq |L|$

Parameters

<i>C</i>	The cursor to put on the POS-th element
<i>POS</i>	The position of the element to move on

Returns

the element at the POS-th position  
 NULL if  $POS \leq 0$  or  $POS > |L|$

See also

**gdsI\_list\_cursor\_move\_to\_value()** (p. 163)

#### 4.11.4.34 **void gdsI\_list\_cursor\_step\_forward( gdsI\_list\_cursor\_t C )**

Move a cursor one step forward of its list.

Move the cursor C one node forward (from head to tail). Does nothing if C is already on its list's tail.

Note

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to use
---	-------------------

**See also**

**`gdsl_list_cursor_step_backward()`** (p. 165)

**Examples:**

**`examples/main_list.c`**.

**4.11.4.35 void `gdsl_list_cursor_step_backward( gsdl_list_cursor_t C )`**

Move a cursor one step backward of its list.

Move the cursor C one node backward (from tail to head.) Does nothing if C is already on its list's head.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to use
---	-------------------

**See also**

**`gdsl_list_cursor_step_forward()`** (p. 164)

**Examples:**

**`examples/main_list.c`**.

**4.11.4.36 bool `gdsl_list_cursor_is_on_head( const gsdl_list_cursor_t C )`**

Check if a cursor is on the head of its list.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to check
---	---------------------

**Returns**

TRUE if C is on its list's head.  
FALSE if C is not on its list's head.

**See also**

**`gdsl_list_cursor_is_on_tail()`** (p. 166)

**4.11.4.37 `bool gdsl_list_cursor_is_on_tail( const gdsl_list_cursor_t C )`**

Check if a cursor is on the tail of its list.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to check
---	---------------------

**Returns**

TRUE if C is on its list's tail.  
FALSE if C is not on its list's tail.

**See also**

**`gdsl_list_cursor_is_on_head()`** (p. 165)

**4.11.4.38** `bool gdsI_list_cursor_has_succ( const gdsI_list_cursor_t C )`

Check if a cursor has a successor.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsI_list_cursor_t`

**Parameters**

<code>C</code>	The cursor to check
----------------	---------------------

**Returns**

TRUE if there exists an element after the cursor C.  
FALSE if there is no element after the cursor C.

**See also**

**`gdsI_list_cursor_has_pred()`** (p. 167)

**4.11.4.39** `bool gdsI_list_cursor_has_pred( const gdsI_list_cursor_t C )`

Check if a cursor has a predecessor.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsI_list_cursor_t`

**Parameters**

<code>C</code>	The cursor to check
----------------	---------------------

**Returns**

TRUE if there exists an element before the cursor C.  
FALSE if there is no element before the cursor C.

See also

**gdsl\_list\_cursor\_has\_succ()** (p. 167)

4.11.4.40 void **gdsl\_list\_cursor\_set\_content**( **gdsl\_list\_cursor\_t** *C*,  
**gdsl\_element\_t** *E* )

Set the content of the cursor.

Set *C*'s element to *E*. The previous element is \*NOT\* deallocated. If it must be deallocated, **gdsl\_list\_cursor\_get\_content()** (p. 168) could be used to get it in order to free it before.

Note

Complexity:  $O(1)$

Precondition

*C* must be a valid **gdsl\_list\_cursor\_t**

Parameters

<i>C</i>	The cursor in which the content must be modified.
<i>E</i>	The value used to modify <i>C</i> 's content.

See also

**gdsl\_list\_cursor\_get\_content()** (p. 168)

4.11.4.41 **gdsl\_element\_t** **gdsl\_list\_cursor\_get\_content**( const **gdsl\_list\_cursor\_t**  
*C* )

Get the content of a cursor.

Note

Complexity:  $O(1)$

Precondition

*C* must be a valid **gdsl\_list\_cursor\_t**

Parameters

<i>C</i>	The cursor to get the content from.
----------	-------------------------------------

**Returns**

the element contained in the cursor C.

**See also**

**gdsl\_list\_cursor\_set\_content()** (p. 168)

**Examples:**

**examples/main\_list.c.**

**4.11.4.42 `gdsl_element_t` `gdsl_list_cursor_insert_after( gdsl_list_cursor_t C, void * VALUE )`**

Insert a new element after a cursor.

A new element is created using `ALLOC_F` called on `VALUE`. `ALLOC_F` is the pointer passed to **gdsl\_list\_alloc()** (p. 142). If the returned value is not `NULL`, then the new element is placed after the cursor C. If C's list is empty, the element is inserted at the head position of C's list.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

<code>C</code>	The cursor after which the new element must be inserted
<code>VALUE</code>	The value used to allocate the new element to insert

**Returns**

the newly inserted element in case of success.  
`NULL` in case of failure.

**See also**

**gdsl\_list\_cursor\_insert\_before()** (p. 170)

**gdsl\_list\_cursor\_remove\_after()** (p. 171)

**gdsl\_list\_cursor\_remove\_before()** (p. 172)

**Examples:**

**examples/main\_list.c.**

#### 4.11.4.43 `gdsl_element_t` `gdsl_list_cursor_insert_before( gdsl_list_cursor_t C, void * VALUE )`

Insert a new element before a cursor.

A new element is created using `ALLOC_F` called on `VALUE`. `ALLOC_F` is the pointer passed to `gdsl_list_alloc()` (p. 142). If the returned value is not `NULL`, then the new element is placed before the cursor `C`. If `C`'s list is empty, the element is inserted at the head position of `C`'s list.

##### Note

Complexity:  $O(1)$

##### Precondition

`C` must be a valid `gdsl_list_cursor_t`

##### Parameters

<code>C</code>	The cursor before which the new element must be inserted
<code>VALUE</code>	The value used to allocate the new element to insert

##### Returns

the newly inserted element in case of success.  
`NULL` in case of failure.

##### See also

`gdsl_list_cursor_insert_after()` (p. 169)  
`gdsl_list_cursor_remove_after()` (p. 171)  
`gdsl_list_cursor_remove_before()` (p. 172)

##### Examples:

`examples/main_list.c`.

#### 4.11.4.44 `gdsl_element_t` `gdsl_list_cursor_remove( gdsl_list_cursor_t C )`

Remove the element under a cursor.

##### Note

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Postcondition**

After this operation, the cursor is positioned on to its successor.

**Parameters**

C	The cursor to remove the content from.
---	--

**Returns**

the removed element if it exists.  
NULL if there is not element to remove.

**See also**

**`gdsl_list_cursor_insert_after()`** (p. 169)  
**`gdsl_list_cursor_insert_before()`** (p. 170)  
**`gdsl_list_cursor_remove()`** (p. 170)  
**`gdsl_list_cursor_remove_before()`** (p. 172)

**4.11.4.45 `gdsl_element_t` `gdsl_list_cursor_remove_after( gdsl_list_cursor_t C )`**

Removec the element after a cursor.

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to remove the successor from.
---	--

**Returns**

the removed element if it exists.  
NULL if there is not element to remove.

See also

**gdsl\_list\_cursor\_insert\_after()** (p. 169)  
**gdsl\_list\_cursor\_insert\_before()** (p. 170)  
**gdsl\_list\_cursor\_remove()** (p. 170)  
**gdsl\_list\_cursor\_remove\_before()** (p. 172)

#### 4.11.4.46 **gdsl\_element\_t** **gdsl\_list\_cursor\_remove\_before( gdsi\_list\_cursor\_t C )**

Remove the element before a cursor.

Note

Complexity:  $O(1)$

Precondition

C must be a valid **gdsi\_list\_cursor\_t**

Parameters

C	The cursor to remove the predecessor from.
---	--

Returns

the removed element if it exists.  
NULL if there is not element to remove.

See also

**gdsl\_list\_cursor\_insert\_after()** (p. 169)  
**gdsl\_list\_cursor\_insert\_before()** (p. 170)  
**gdsl\_list\_cursor\_remove()** (p. 170)  
**gdsl\_list\_cursor\_remove\_after()** (p. 171)

#### 4.11.4.47 **gdsi\_list\_cursor\_t** **gdsi\_list\_cursor\_delete( gdsi\_list\_cursor\_t C )**

Delete the element under a cursor.

Remove the element under the cursor C. The removed element is also deallocated using **FREE\_F** passed to **gdsi\_list\_alloc()** (p. 142).

Complexity:  $O(1)$

Precondition

C must be a valid **gdsi\_list\_cursor\_t**

## Parameters

C	The cursor to delete the content.
---	-----------------------------------

## Returns

the cursor C if the element was removed.  
NULL if there is not element to remove.

## See also

**gdsI\_list\_cursor\_delete\_before()** (p. 173)

**gdsI\_list\_cursor\_delete\_after()** (p. 173)

4.11.4.48 **gdsI\_list\_cursor\_t gdsI\_list\_cursor\_delete\_after( gdsI\_list\_cursor\_t C )**

Delete the element after a cursor.

Remove the element after the cursor C. The removed element is also deallocated using FREE\_F passed to **gdsI\_list\_alloc()** (p. 142).

Complexity: O( 1 )

## Precondition

C must be a valid gdsI\_list\_cursor\_t

## Parameters

C	The cursor to delete the successor from.
---	--

## Returns

the cursor C if the element was removed.  
NULL if there is not element to remove.

## See also

**gdsI\_list\_cursor\_delete()** (p. 172)

**gdsI\_list\_cursor\_delete\_before()** (p. 173)

## Examples:

**examples/main\_list.c.**

4.11.4.49 **gdsI\_list\_cursor\_t gdsI\_list\_cursor\_delete\_before( gdsI\_list\_cursor\_t C )**

Delete the element before the cursor of a list.

Remove the element before the cursor C. The removed element is also deallocated using FREE\_F passed to **gdsl\_list\_alloc()** (p. 142).

**Note**

Complexity:  $O(1)$

**Precondition**

C must be a valid `gdsl_list_cursor_t`

**Parameters**

C	The cursor to delete the predecessor from.
---	--

**Returns**

the cursor C if the element was removed.  
NULL if there is not element to remove.

**See also**

**gdsl\_list\_cursor\_delete()** (p. 172)

**gdsl\_list\_cursor\_delete\_after()** (p. 173)

*Give the lowest number of two numbers.*

#### 4.12.3 Define Documentation

##### 4.12.3.1 `#define GDSL_MAX( X, Y ) (X>Y?X:Y)`

Give the greatest number of two numbers.

#### Note

Complexity:  $O(1)$

#### Precondition

X & Y must be basic scalar C types

#### Parameters

X	First scalar variable
Y	Second scalar variable

**Returns**

X if X is greater than Y.  
Y if Y is greater than X.

**See also**

**GDSL\_MIN()** (p. 176)

Definition at line 72 of file gdsl\_macros.h.

**4.12.3.2 #define GDSL\_MIN( X, Y ) (X>Y?Y:X)**

Give the lowest number of two numbers.

**Note**

Complexity:  $O(1)$

**Precondition**

X & Y must be basic scalar C types

**Parameters**

X	First scalar variable
Y	Second scalar variable

**Returns**

Y if Y is lower than X.  
X if X is lower than Y.

**See also**

**GDSL\_MAX()** (p. 175)

Definition at line 89 of file gdsl\_macros.h.

*Write the elements of a permutation to a file.*
- void **gdsI\_perm\_write\_xml** (const **gdsI\_perm\_t** P, const **gdsI\_write\_func\_t** WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)
 

*Write the elements of a permutation to a file into XML.*

- void **gdsl\_perm\_dump** (const **gdsl\_perm\_t** P, const **gdsl\_write\_func\_t** WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)

*Dump the internal structure of a permutation to a file.*

### 4.13.3 Typedef Documentation

#### 4.13.3.1 typedef struct **gdsl\_perm\*** **gdsl\_perm\_t**

GDSL permutation type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 69 of file `gdsl_perm.h`.

#### 4.13.3.2 typedef void(\* **gdsl\_perm\_write\_func\_t**)(ulong E, FILE \*OUTPUT\_FILE, **gdsl\_location\_t** POSITION, void \*USER\_DATA)

GDSL permutation write function type.

##### Parameters

<i>E</i>	The permutation element to write
<i>OUTPUT_FILE</i>	The file where to write E
<i>POSITION</i>	is an or-ed combination of <code>gdsl_perm_position_t</code> values to indicate where E is located into the <code>gdsl_perm_t</code> mapped.
<i>USER_DATA</i>	User's datas

Definition at line 93 of file `gdsl_perm.h`.

#### 4.13.3.3 typedef struct **gdsl\_perm\_data\*** **gdsl\_perm\_data\_t**

Definition at line 99 of file `gdsl_perm.h`.

### 4.13.4 Enumeration Type Documentation

#### 4.13.4.1 enum **gdsl\_perm\_position\_t**

This type is for `gdsl_perm_write_func_t`.

Enumerator:

**GDSL\_PERM\_POSITION\_FIRST** When element is at first position

**GDSL\_PERM\_POSITION\_LAST** When element is at last position

Definition at line 74 of file `gdsl_perm.h`.

### 4.13.5 Function Documentation

#### 4.13.5.1 `gdsl_perm_t` `gdsl_perm_alloc` ( `const char * NAME`, `const ulong N` )

Create a new permutation.

Allocate a new permutation data structure of size `N` with name is set to a copy of `NAME`.

#### Note

Complexity:  $O(N)$

#### Precondition

$N > 0$

#### Parameters

<code>N</code>	The number of elements of the permutation to create.
<code>NAME</code>	The name of the new permutation to create

#### Returns

the newly allocated identity permutation in its linear form in case of success.  
 NULL in case of insufficient memory.

#### See also

`gdsl_perm_free()` (p. 180)

`gdsl_perm_copy()` (p. 181)

#### Examples:

`examples/main_bstree.c`, `examples/main_list.c`, `examples/main_llbstree.c`,  
`examples/main_perm.c`, and `examples/main_rbstree.c`.

#### 4.13.5.2 `void` `gdsl_perm_free` ( `gdsl_perm_t P` )

Destroy a permutation.

Deallocate the permutation `P`.

#### Note

Complexity:  $O(|P|)$

#### Precondition

`P` must be a valid `gdsl_perm_t`

## Parameters

$P$	The permutation to destroy
-----	----------------------------

## See also

**gdsI\_perm\_alloc()** (p. 180)

**gdsI\_perm\_copy()** (p. 181)

## Examples:

**examples/main\_bstree.c**, **examples/main\_list.c**, **examples/main\_llbstree.c**,  
**examples/main\_perm.c**, and **examples/main\_rbtrees.c**.

4.13.5.3 **gdsI\_perm\_t gdsI\_perm\_copy( const gdsI\_perm\_t P )**

Copy a permutation.

Create and return a copy of the permutation P.

## Note

Complexity:  $O(|P|)$

## Precondition

P must be a valid gdsI\_perm\_t.

## Postcondition

The returned permutation must be deallocated with gdsI\_perm\_free.

## Parameters

$P$	The permutation to copy.
-----	--------------------------

## Returns

a copy of P in case of success.

NULL in case of insufficient memory.

## See also

**gdsI\_perm\_alloc** (p. 180)

**gdsI\_perm\_free** (p. 180)

#### 4.13.5.4 `const char* gdsI_perm_get_name( const gdsI_perm_t P )`

Get the name of a permutation.

##### Note

Complexity:  $O( 1 )$

##### Precondition

P must be a valid `gdsI_perm_t`

##### Postcondition

The returned string MUST NOT be freed.

##### Parameters

<i>P</i>	The permutation to get the name from
----------	--------------------------------------

##### Returns

the name of the permutation P.

##### See also

**`gdsI_perm_set_name()`** (p. 186)

#### 4.13.5.5 `ulong gdsI_perm_get_size( const gdsI_perm_t P )`

Get the size of a permutation.

##### Note

Complexity:  $O( 1 )$

##### Precondition

P must be a valid `gdsI_perm_t`

##### Parameters

<i>P</i>	The permutation to get the size from.
----------	---------------------------------------

**Returns**

the number of elements of  $P$  (noted  $|P|$ ).

**See also**

**gdsI\_perm\_get\_element()** (p. 183)

**gdsI\_perm\_get\_elements\_array()** (p. 183)

#### 4.13.5.6 `ulong gdsI_perm_get_element( const gdsI_perm_t P, const ulong INDIX )`

Get the  $(INDIX+1)$ -th element from a permutation.

**Note**

Complexity:  $O(1)$

**Precondition**

$P$  must be a valid `gdsI_perm_t` &  $0 \leq INDIX < |P|$

**Parameters**

<i>P</i>	The permutation to use.
<i>INDIX</i>	The index of the value to get.

**Returns**

the value at the  $INDIX$ -th position in the permutation  $P$ .

**See also**

**gdsI\_perm\_get\_size()** (p. 182)

**gdsI\_perm\_get\_elements\_array()** (p. 183)

**Examples:**

`examples/main_bstree.c`, `examples/main_list.c`, `examples/main_llbstree.c`,  
and `examples/main_rbtree.c`.

#### 4.13.5.7 `ulong* gdsI_perm_get_elements_array( const gdsI_perm_t P )`

Get the array elements of a permutation.

**Note**

Complexity:  $O(1)$

**Precondition**

P must be a valid `gdsI_perm_t`

**Parameters**

<i>P</i>	The permutation to get datas from.
----------	------------------------------------

**Returns**

the values array of the permutation P.

**See also**

**`gdsI_perm_get_element()`** (p. 183)

**`gdsI_perm_set_elements_array()`** (p. 188)

**4.13.5.8 `ulong gdsI_perm_linear_inversions_count( const gdsI_perm_t P )`**

Count the inversions number into a linear permutation.

**Note**

Complexity:  $O(|P|)$

**Precondition**

P must be a valid linear `gdsI_perm_t`

**Parameters**

<i>P</i>	The linear permutation to use.
----------	--------------------------------

**Returns**

the number of inversions into the linear permutation P.

**Examples:**

**`examples/main_perm.c`**.

**4.13.5.9 `ulong gdsI_perm_linear_cycles_count( const gdsI_perm_t P )`**

Count the cycles number into a linear permutation.

**Note**

Complexity:  $O(|P|)$

**Precondition**

$P$  must be a valid linear `gdsI_perm_t`

**Parameters**

$P$	The linear permutation to use.
-----	--------------------------------

**Returns**

the number of cycles into the linear permutation  $P$ .

**See also**

**`gdsI_perm_canonical_cycles_count()`** (p. 185)

**Examples:**

**`examples/main_perm.c`**.

**4.13.5.10 `ulong gdsI_perm_canonical_cycles_count( const gdsI_perm_t P )`**

Count the cycles number into a canonical permutation.

**Note**

Complexity:  $O(|P|)$

**Precondition**

$P$  must be a valid canonical `gdsI_perm_t`

**Parameters**

$P$	The canonical permutation to use.
-----	-----------------------------------

**Returns**

the number of cycles into the canonical permutation  $P$ .

See also

**gdsI\_perm\_linear\_cycles\_count()** (p. 184)

Examples:

**examples/main\_perm.c.**

4.13.5.11 **gdsI\_perm\_t gdsI\_perm\_set\_name ( gdsI\_perm\_t P, const char \*  
NEW\_NAME )**

Set the name of a permutation.

Change the previous name of the permutation P to a copy of NEW\_NAME.

Note

Complexity:  $O(1)$

Precondition

P must be a valid gdsI\_perm\_t

Parameters

<i>P</i>	The permutation to change the name
<i>NEW_NAME</i>	The new name of P

Returns

the modified permutation in case of success.

NULL in case of insufficient memory.

See also

**gdsI\_perm\_get\_name()** (p. 182)

4.13.5.12 **gdsI\_perm\_t gdsI\_perm\_linear\_next ( gdsI\_perm\_t P )**

Get the next permutation from a linear permutation.

The permutation P is modified to become the next permutation after P.

Note

Complexity:  $O(|P|)$

**Precondition**

$P$  must be a valid linear `gdsI_perm_t` &  $|P| > 1$

**Parameters**

$P$	The linear permutation to modify
-----	----------------------------------

**Returns**

the next permutation after the permutation  $P$ .  
NULL if  $P$  is already the last permutation.

**See also**

**`gdsI_perm_linear_prev()`** (p. 187)

**4.13.5.13 `gdsI_perm_t gdsI_perm_linear_prev( gdsI_perm_t P )`**

Get the previous permutation from a linear permutation.

The permutation  $P$  is modified to become the previous permutation before  $P$ .

**Note**

Complexity:  $O(|P|)$

**Precondition**

$P$  must be a valid linear `gdsI_perm_t` &  $|P| \geq 2$

**Parameters**

$P$	The linear permutation to modify
-----	----------------------------------

**Returns**

the previous permutation before the permutation  $P$ .  
NULL if  $P$  is already the first permutation.

**See also**

**`gdsI_perm_linear_next()`** (p. 186)

#### 4.13.5.14 `gdsI_perm_t gdsI_perm_set_elements_array( gdsI_perm_t P, const - ulong * ARRAY )`

Initialize a permutation with an array of values.

Initialize the permutation P with the values contained in the array of values ARRAY. If ARRAY does not design a permutation, then P is left unchanged.

##### Note

Complexity:  $O(|P|)$

##### Precondition

P must be a valid `gdsI_perm_t` &  $V \neq \text{NULL}$  &  $|V| == |P|$

##### Parameters

<i>P</i>	The permutation to initialize
<i>ARRAY</i>	The array of values to initialize P

##### Returns

the modified permutation in case of success.  
NULL in case V does not design a valid permutation.

##### See also

**`gdsI_perm_get_elements_array()`** (p. 183)

#### 4.13.5.15 `gdsI_perm_t gdsI_perm_multiply( gdsI_perm_t RESULT, const - gdsI_perm_t ALPHA, const gdsI_perm_t BETA )`

Multiply two permutations.

Compute the product of the permutations ALPHA x BETA and puts the result in RESULT without modifying ALPHA and BETA.

##### Note

Complexity:  $O(|RESULT|)$

##### Precondition

RESULT, ALPHA and BETA must be valids `gdsI_perm_t` &  $|RESULT| == |ALPHA| == |BETA|$

##### Parameters

<i>RESULT</i>	The result of the product ALPHA x BETA
<i>ALPHA</i>	The first permutation used in the product
<i>BETA</i>	The second permutation used in the product

**Returns**

RESULT, the result of the multiplication ALPHA x BETA.

#### 4.13.5.16 `gdsI_perm_t gdsI_perm_linear_to_canonical( gdsI_perm_t Q, const gdsI_perm_t P )`

Convert a linear permutation to its canonical form.

Convert the linear permutation P to its canonical form. The resulted canonical permutation is placed into Q without modifying P.

**Note**

Complexity:  $O(|P|)$

**Precondition**

P & Q must be valids `gdsI_perm_t` &  $|P| == |Q|$  &  $P \neq Q$

**Parameters**

<i>Q</i>	The canonical form of P
<i>P</i>	The linear permutation used to compute its canonical form into Q

**Returns**

the canonical form Q of the permutation P.

**See also**

`gdsI_perm_canonical_to_linear()` (p. 189)

**Examples:**

`examples/main_perm.c`.

#### 4.13.5.17 `gdsI_perm_t gdsI_perm_canonical_to_linear( gdsI_perm_t Q, const gdsI_perm_t P )`

Convert a canonical permutation to its linear form.

Convert the canonical permutation  $P$  to its linear form. The resulted linear permutation is placed into  $Q$  without modifying  $P$ .

#### Note

Complexity:  $O(|P|)$

#### Precondition

$P$  &  $Q$  must be valids `gdsl_perm_t` &  $|P| == |Q|$  &  $P \neq Q$

#### Parameters

$Q$	The linear form of $P$
$P$	The canonical permutation used to compute its linear form into $Q$

#### Returns

the linear form  $Q$  of the permutation  $P$ .

#### See also

**`gdsl_perm_linear_to_canonical()`** (p. 189)

#### Examples:

**`examples/main_perm.c`**.

#### 4.13.5.18 `gdsl_perm_t gdsi_perm_inverse( gdsi_perm_t P )`

Inverse in place a permutation.

#### Note

Complexity:  $O(|P|)$

#### Precondition

$P$  must be a valid `gdsi_perm_t`

#### Parameters

$P$	The permutation to invert
-----	---------------------------

**Returns**

the inverse permutation of P in case of success.  
NULL in case of insufficient memory.

**See also**

**gdsI\_perm\_reverse()** (p. 191)

**Examples:**

**examples/main\_perm.c.**

**4.13.5.19 gdsI\_perm\_t gdsI\_perm\_reverse( gdsI\_perm\_t P )**

Reverse in place a permutation.

**Note**

Complexity:  $O(|P| / 2)$

**Precondition**

P must be a valid gdsI\_perm\_t

**Parameters**

<i>P</i>	The permutation to reverse
----------	----------------------------

**Returns**

the mirror image of the permutation P

**See also**

**gdsI\_perm\_inverse()** (p. 190)

**Examples:**

**examples/main\_perm.c.**

**4.13.5.20 gdsI\_perm\_t gdsI\_perm\_randomize( gdsI\_perm\_t P )**

Randomize a permutation.

The permutation P is randomized in an efficient way, using inversions array.

**Note**

Complexity:  $O(|P|)$

**Precondition**

P must be a valid `gdsl_perm_t`

**Parameters**

<i>P</i>	The permutation to randomize
----------	------------------------------

**Returns**

the mirror image  $\sim P$  of the permutation of P in case of success.  
 NULL in case of insufficient memory.

**Examples:**

**examples/main\_bstree.c**, **examples/main\_list.c**, **examples/main\_llbtree.c**,  
**examples/main\_perm.c**, and **examples/main\_rbtree.c**.

#### 4.13.5.21 `gdsl_element_t* gdsl_perm_apply_on_array( gdsl_element_t* V, const gdsl_perm_t P )`

Apply a permutation on to a vector.

**Note**

Complexity:  $O(|P|)$

**Precondition**

P must be a valid `gdsl_perm_t` &  $|P| == |V|$

**Parameters**

<i>V</i>	The vector/array to reorder according to P
<i>P</i>	The permutation to use to reorder V

**Returns**

the reordered array V according to the permutation P in case of success.  
 NULL in case of insufficient memory.

**Examples:**

**examples/main\_perm.c**.

4.13.5.22 `void gdsI_perm_write ( const gdsI_perm_t P, const gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the elements of a permutation to a file.

Write the elements of the permutation P to OUTPUT\_FILE, using WRITE\_F function. Additional USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|P|)$

#### Precondition

P must be a valid gdsI\_perm\_t & WRITE\_F != NULL & OUTPUT\_FILE != NULL

#### Parameters

<i>P</i>	The permutation to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write P's elements.
<i>USER_DATA</i>	User's datas passed to WRITE_F.

#### See also

`gdsI_perm_write_xml()` (p. 193)

`gdsI_perm_dump()` (p. 194)

#### Examples:

`examples/main_perm.c`.

4.13.5.23 `void gdsI_perm_write_xml ( const gdsI_perm_t P, const gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the elements of a permutation to a file into XML.

Write the elements of the permutation P to OUTPUT\_FILE, into XML language. If WRITE\_F != NULL, then uses WRITE\_F function to write P's elements to OUTPUT\_FILE. Additional USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|P|)$

**Precondition**

P must be a valid `gdsl_perm_t` & `OUTPUT_FILE` != NULL

**Parameters**

<i>P</i>	The permutation to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write P's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

**See also**

**`gdsl_perm_write()`** (p. 193)

**`gdsl_perm_dump()`** (p. 194)

4.13.5.24 `void gsdl_perm_dump ( const gsdl_perm_t P, const gsdl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a permutation to a file.

Dump the structure of the permutation P to `OUTPUT_FILE`. If `WRITE_F` != NULL, then uses `WRITE_F` function to write P's elements to `OUTPUT_FILE`. Additional `USER_DATA` argument could be passed to `WRITE_F`.

**Note**

Complexity:  $O(|P|)$

**Precondition**

P must be a valid `gdsl_perm_t` & `OUTPUT_FILE` != NULL

**Parameters**

<i>P</i>	The permutation to dump.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write P's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

**See also**

**`gdsl_perm_write()`** (p. 193)

**`gdsl_perm_write_xml()`** (p. 193)

### 4.14.3 Typedef Documentation

#### 4.14.3.1 typedef struct \_gsdl\_queue\* gsdl\_queue\_t

GDSL queue type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 74 of file gsdl\_queue.h.

### 4.14.4 Function Documentation

#### 4.14.4.1 gsdl\_queue\_t gsdl\_queue\_alloc( const char \* NAME, gsdl\_alloc\_func\_t ALLOC\_F, gsdl\_free\_func\_t FREE\_F )

Create a new queue.

Allocate a new queue data structure which name is set to a copy of NAME. The functions pointers ALLOC\_F and FREE\_F could be used to respectively, alloc and free elements in the queue. These pointers could be set to NULL to use the default ones:

- the default `ALLOC_F` simply returns its argument
- the default `FREE_F` does nothing

**Note**

Complexity:  $O(1)$

**Precondition**

nothing.

**Parameters**

<i>NAME</i>	The name of the new queue to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in a queue
<i>FREE_F</i>	Function to free element when deleting it from a queue

**Returns**

the newly allocated queue in case of success.  
NULL in case of insufficient memory.

**See also**

**`gdsI_queue_free()`** (p. 197)  
**`gdsI_queue_flush()`** (p. 198)

**Examples:**

**`examples/main_queue.c`**.

**4.14.4.2 void `gdsI_queue_free( gdsI_queue_t Q )`**

Destroy a queue.

Deallocate all the elements of the queue `Q` by calling `Q`'s `FREE_F` function passed to **`gdsI_queue_alloc()`** (p. 196). The name of `Q` is deallocated and `Q` is deallocated itself too.

**Note**

Complexity:  $O(|Q|)$

**Precondition**

`Q` must be a valid `gdsI_queue_t`

## Parameters

Q	The queue to destroy
---	----------------------

## See also

**gdsl\_queue\_alloc()** (p. 196)

**gdsl\_queue\_flush()** (p. 198)

## Examples:

**examples/main\_queue.c.**

4.14.4.3 void `gdsl_queue_flush( gsdl_queue_t Q )`

Flush a queue.

Deallocate all the elements of the queue Q by calling Q's FREE\_F function passed to `gsdl_queue_alloc()`. Q is not deallocated itself and Q's name is not modified.

## Note

Complexity:  $O(|Q|)$

## Precondition

Q must be a valid `gsdl_queue_t`

## Parameters

Q	The queue to flush
---	--------------------

## See also

**gsdl\_queue\_alloc()** (p. 196)

**gsdl\_queue\_free()** (p. 197)

## Examples:

**examples/main\_queue.c.**

4.14.4.4 const char\* `gsdl_queue_get_name( const gsdl_queue_t Q )`

Getsthe name of a queue.

## Note

Complexity:  $O(1)$

**Precondition**

Q must be a valid `gdsl_queue_t`

**Postcondition**

The returned string **MUST NOT** be freed.

**Parameters**

Q	The queue to get the name from
---	--------------------------------

**Returns**

the name of the queue Q.

**See also**

**`gdsl_queue_set_name()`** (p. 201)

**Examples:**

**`examples/main_queue.c`**.

**4.14.4.5 `ulong gdsl_queue_get_size( const gdsl_queue_t Q )`**

Get the size of a queue.

**Note**

Complexity:  $O(1)$

**Precondition**

Q must be a valid `gdsl_queue_t`

**Parameters**

Q	The queue to get the size from
---	--------------------------------

**Returns**

the number of elements of Q (noted  $|Q|$ ).

#### 4.14.4.6 `bool gdsi_queue_is_empty( const gdsi_queue_t Q )`

Check if a queue is empty.

##### Note

Complexity:  $O(1)$

##### Precondition

Q must be a valid `gdsi_queue_t`

##### Parameters

Q	The queue to check
---	--------------------

##### Returns

TRUE if the queue Q is empty.  
FALSE if the queue Q is not empty.

##### Examples:

**examples/main\_queue.c.**

#### 4.14.4.7 `gdsi_element_t gdsi_queue_get_head( const gdsi_queue_t Q )`

Get the head of a queue.

##### Note

Complexity:  $O(1)$

##### Precondition

Q must be a valid `gdsi_queue_t`

##### Parameters

Q	The queue to get the head from
---	--------------------------------

##### Returns

the element contained at the header position of the queue Q if Q is not empty. The returned element is not removed from Q.  
NULL if the queue Q is empty.

See also

**gdsI\_queue\_get\_tail()** (p. 201)

Examples:

**examples/main\_queue.c.**

#### 4.14.4.8 `gdsI_element_t gdsI_queue_get_tail( const gdsI_queue_t Q )`

Get the tail of a queue.

Note

Complexity:  $O(1)$

Precondition

Q must be a valid `gdsI_queue_t`

Parameters

Q	The queue to get the tail from
---	--------------------------------

Returns

the element contained at the footer position of the queue Q if Q is not empty. The returned element is not removed from Q.  
NULL if the queue Q is empty.

See also

**gdsI\_queue\_get\_head()** (p. 200)

Examples:

**examples/main\_queue.c.**

#### 4.14.4.9 `gdsI_queue_t gdsI_queue_set_name( gdsI_queue_t Q, const char * NEW_NAME )`

Set the name of a queue.

Change the previous name of the queue Q to a copy of NEW\_NAME.

Note

Complexity:  $O(1)$

**Precondition**

Q must be a valid `gdsl_queue_t`

**Parameters**

Q	The queue to change the name
NEW_NAME	The new name of Q

**Returns**

the modified queue in case of success.  
 NULL in case of insufficient memory.

**See also**

**`gdsl_queue_get_name()`** (p. 198)

#### 4.14.4.10 `gsdl_element_t gsdl_queue_insert( gsdl_queue_t Q, void * VALUE )`

Insert an element in a queue (PUT).

Allocate a new element E by calling Q's `ALLOC_F` function on `VALUE`. `ALLOC_F` is the function pointer passed to **`gsdl_queue_alloc()`** (p. 196). The new element E is then inserted at the header position of the queue Q.

**Note**

Complexity:  $O(1)$

**Precondition**

Q must be a valid `gsdl_queue_t`

**Parameters**

Q	The queue to insert in
VALUE	The value used to make the new element to insert into Q

**Returns**

the inserted element E in case of success.  
 NULL in case of insufficient memory.

See also

**gdsI\_queue\_remove()** (p. 203)

Examples:

**examples/main\_queue.c.**

#### 4.14.4.11 `gdsI_element_t gdsI_queue_remove( gdsI_queue_t Q )`

Remove an element from a queue (GET).

Remove the element at the footer position of the queue Q.

Note

Complexity:  $O(1)$

Precondition

Q must be a valid `gdsI_queue_t`

Parameters

Q	The queue to remove the tail from
---	-----------------------------------

Returns

the removed element in case of success.

NULL in case of Q is empty.

See also

**gdsI\_queue\_insert()** (p. 202)

Examples:

**examples/main\_queue.c.**

#### 4.14.4.12 `gdsI_element_t gdsI_queue_search( const gdsI_queue_t Q, gdsI_compare_func_t COMP_F, void * VALUE )`

Search for a particular element in a queue.

Search for the first element E equal to VALUE in the queue Q, by using COMP\_F to compare all Q's element with.

**Note**

Complexity:  $O(|Q| / 2)$

**Precondition**

Q must be a valid `gdsl_queue_t` & `COMP_F` != NULL

**Parameters**

<code>Q</code>	The queue to search the element in
<code>COMP_F</code>	The comparison function used to compare Q's element with VALUE
<code>VALUE</code>	The value to compare Q's elements with

**Returns**

the first founded element E in case of success.  
 NULL in case the searched element E was not found.

**See also**

**`gdsl_queue_search_by_position`** (p. 204)

#### 4.14.4.13 `gdsl_element_t` `gdsl_queue_search_by_position`( `const` `gdsl_queue_t` Q, `ulong` POS )

Search for an element by its position in a queue.

**Note**

Complexity:  $O(|Q| / 2)$

**Precondition**

Q must be a valid `gdsl_queue_t` & `POS` > 0 & `POS` <= |Q|

**Parameters**

<code>Q</code>	The queue to search the element in
<code>POS</code>	The position where is the element to search

**Returns**

the element at the POS-th position in the queue Q.  
 NULL if `POS` > |L| or `POS` <= 0.

See also

**gdsl\_queue\_search()** (p. 203)

Examples:

**examples/main\_queue.c.**

4.14.4.14 **gdsl\_element\_t** **gdsl\_queue\_map\_forward**( const **gdsl\_queue\_t** *Q*,  
**gdsl\_map\_func\_t** *MAP\_F*, void \* *USER\_DATA* )

Parse a queue from head to tail.

Parse all elements of the queue *Q* from head to tail. The *MAP\_F* function is called on each *Q*'s element with *USER\_DATA* argument. If *MAP\_F* returns **GDSL\_MAP\_STOP**, then **gdsl\_queue\_map\_forward()** (p. 205) stops and returns its last examined element.

Note

Complexity:  $O(|Q|)$

Precondition

*Q* must be a valid **gdsl\_queue\_t** & *MAP\_F* != NULL

Parameters

<i>Q</i>	The queue to parse
<i>MAP_F</i>	The map function to apply on each <i>Q</i> 's element
<i>USER_DATA</i>	User's datas passed to <i>MAP_F</i>
<i>A</i>	

Returns

the first element for which *MAP\_F* returns **GDSL\_MAP\_STOP**.  
NULL when the parsing is done.

See also

**gdsl\_queue\_map\_backward()** (p. 206)

Examples:

**examples/main\_queue.c.**

#### 4.14.4.15 `gdsl_element_t` `gdsl_queue_map_backward` ( `const` `gdsl_queue_t` *Q*, `gdsl_map_func_t` *MAP\_F*, `void *` *USER\_DATA* )

Parse a queue from tail to head.

Parse all elements of the queue *Q* from tail to head. The *MAP\_F* function is called on each *Q*'s element with *USER\_DATA* argument. If *MAP\_F* returns `GDSL_MAP_STOP`, then `gdsl_queue_map_backward()` (p.206) stops and returns its last examined element.

##### Note

Complexity:  $O(|Q|)$

##### Precondition

*Q* must be a valid `gdsl_queue_t` & *MAP\_F* != NULL

##### Parameters

<i>Q</i>	The queue to parse
<i>MAP_F</i>	The map function to apply on each <i>Q</i> 's element
<i>USER_DATA</i>	User's datas passed to <i>MAP_F</i> Returns the first element for which <i>MAP_F</i> returns <code>GDSL_MAP_STOP</code> . Returns NULL when the parsing is done.

##### See also

`gdsl_queue_map_forward()` (p. 205)

#### 4.14.4.16 `void` `gdsl_queue_write` ( `const` `gdsl_queue_t` *Q*, `gdsl_write_func_t` *WRITE\_F*, `FILE *` *OUTPUT\_FILE*, `void *` *USER\_DATA* )

Write all the elements of a queue to a file.

Write the elements of the queue *Q* to *OUTPUT\_FILE*, using *WRITE\_F* function. - Additionaln *USER\_DATA* argument could be passed to *WRITE\_F*.

##### Note

Complexity:  $O(|Q|)$

##### Precondition

*Q* must be a valid `gdsl_queue_t` & *OUTPUT\_FILE* != NULL & *WRITE\_F* != NULL

## Parameters

<code>Q</code>	The queue to write.
<code>WRITE_F</code>	The write function.
<code>OUTPUT_FILE</code>	The file where to write Q's elements.
<code>USER_DATA</code>	User's datas passed to <code>WRITE_F</code> .

## See also

**`gdsI_queue_write_xml()`** (p. 207)

**`gdsI_queue_dump()`** (p. 208)

4.14.4.17 `void gdsI_queue_write_xml( const gdsI_queue_t Q, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a queue to a file into XML.

Write the elements of the queue `Q` to `OUTPUT_FILE`, into XML language. If `WRITE_F`  $\neq$  `NULL`, then uses `WRITE_F` to write Q's elements to `OUTPUT_FILE`. Additional `USER_DATA` argument could be passed to `WRITE_F`.

## Note

Complexity:  $O(|Q|)$

## Precondition

`Q` must be a valid `gdsI_queue_t` & `OUTPUT_FILE`  $\neq$  `NULL`

## Parameters

<code>Q</code>	The queue to write.
<code>WRITE_F</code>	The write function.
<code>OUTPUT_FILE</code>	The file where to write Q's elements.
<code>USER_DATA</code>	User's datas passed to <code>WRITE_F</code> .

## See also

**`gdsI_queue_write()`** (p. 206)

**`gdsI_queue_dump()`** (p. 208)

## Examples:

**`examples/main_queue.c`**.

4.14.4.18 `void gdsI_queue_dump( const gdsI_queue_t Q, gdsI_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a queue to a file.

Dump the structure of the queue Q to OUTPUT\_FILE. If WRITE\_F != NULL, then uses WRITE\_F to write Q's elements to OUTPUT\_FILE. Additionnal USER\_DATA argument could be passed to WRITE\_F.

#### Note

Complexity:  $O(|Q|)$

#### Precondition

Q must be a valid gdsI\_queue\_t & OUTPUT\_FILE != NULL

#### Parameters

Q	The queue to write.
WRITE_F	The write function.
OUTPUT_FILE	The file where to write Q's elements.
USER_DATA	User's datas passed to WRITE_F.

#### See also

`gdsI_queue_write()` (p. 206)

`gdsI_queue_write_xml()` (p. 207)

#### Examples:

`examples/main_queue.c`.

*Dump the internal structure of a red-black tree to a file.*

### 4.15.3 Typedef Documentation

#### 4.15.3.1 typedef struct gsdl\_rbtrees\* gsdl\_rbtrees\_t

GDSL red-black tree type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 71 of file gsdl\_rbtrees.h.

### 4.15.4 Function Documentation

#### 4.15.4.1 gsdl\_rbtrees\_t gsdl\_rbtrees\_alloc( const char \* NAME, gsdl\_alloc\_func\_t ALLOC\_F, gsdl\_free\_func\_t FREE\_F, gsdl\_compare\_func\_t COMP\_F )

Create a new red-black tree.

Allocate a new red-black tree data structure which name is set to a copy of NAME. The function pointers ALLOC\_F, FREE\_F and COMP\_F could be used to respectively, alloc, free and compares elements in the tree. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing
- the default COMP\_F always returns 0

**Note**

Complexity:  $O(1)$

**Precondition**

nothing

**Parameters**

<i>NAME</i>	The name of the new red-black tree to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in a r-b tree
<i>FREE_F</i>	Function to free element when removing it from a r-b tree
<i>COMP_F</i>	Function to compare elements into the r-b tree

**Returns**

the newly allocated red-black tree in case of success.  
NULL in case of failure.

**See also**

**gdsI\_rbtrees\_free()** (p. 211)  
**gdsI\_rbtrees\_flush()** (p. 212)

**Examples:**

**examples/main\_rbtrees.c.**

**4.15.4.2 void gdsI\_rbtrees\_free ( gdsI\_rbtrees\_t T )**

Destroy a red-black tree.

Deallocate all the elements of the red-black tree T by calling T's FREE\_F function passed to **gdsI\_rbtrees\_alloc()** (p. 210). The name of T is deallocated and T is deallocated itself too.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gds_l_rbtrees_t`

**Parameters**

<b>T</b>	The red-black tree to deallocate
----------	----------------------------------

**See also**

**`gds_l_rbtrees_alloc()`** (p. 210)

**`gds_l_rbtrees_flush()`** (p. 212)

**Examples:**

**`examples/main_rbtrees.c`**.

**4.15.4.3 void `gds_l_rbtrees_flush( gds_l_rbtrees_t T )`**

Flush a red-black tree.

Deallocate all the elements of the red-black tree T by calling T's `FREE_F` function passed to **`gds_l_rbtrees_alloc()`** (p. 210). The red-black tree T is not deallocated itself and its name is not modified.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gds_l_rbtrees_t`

**See also**

**`gds_l_rbtrees_alloc()`** (p. 210)

**`gds_l_rbtrees_free()`** (p. 211)

**Examples:**

**`examples/main_rbtrees.c`**.

4.15.4.4 `char* gdsi_rbtrees_get_name( const gdsi_rbtrees_t T )`

Get the name of a red-black tree.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a valid `gdsi_rbtrees_t`

**Postcondition**

The returned string **MUST NOT** be freed.

**Parameters**

<code>T</code>	The red-black tree to get the name from
----------------	---

**Returns**

the name of the red-black tree T.

**See also**

**`gdsi_rbtrees_set_name()`** (p. 215)

4.15.4.5 `bool gdsi_rbtrees_is_empty( const gdsi_rbtrees_t T )`

Check if a red-black tree is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a valid `gdsi_rbtrees_t`

**Parameters**

<code>T</code>	The red-black tree to check
----------------	-----------------------------

**Returns**

TRUE if the red-black tree  $T$  is empty.  
FALSE if the red-black tree  $T$  is not empty.

**Examples:**

**examples/main\_rbtrees.c.**

**4.15.4.6 `gdsI_element_t gdsI_rbtrees_get_root( const gdsI_rbtrees_t T )`**

Get the root of a red-black tree.

**Note**

Complexity:  $O(1)$

**Precondition**

$T$  must be a valid `gdsI_rbtrees_t`

**Parameters**

$T$	The red-black tree to get the root element from
-----	---

**Returns**

the element at the root of the red-black tree  $T$ .

**Examples:**

**examples/main\_rbtrees.c.**

**4.15.4.7 `ulong gdsI_rbtrees_get_size( const gdsI_rbtrees_t T )`**

Get the size of a red-black tree.

**Note**

Complexity:  $O(1)$

**Precondition**

$T$  must be a valid `gdsI_rbtrees_t`

**Parameters**

$T$	The red-black tree to get the size from
-----	---

**Returns**

the size of the red-black tree  $T$  (noted  $|T|$ ).

**See also**

`gdsI_rbtree_get_height()`

**Examples:**

`examples/main_rbtree.c`.

**4.15.4.8 `ulong gdsI_rbtree_height( const gdsI_rbtree_t T )`**

Get the height of a red-black tree.

**Note**

Complexity:  $O(|T|)$

**Precondition**

$T$  must be a valid `gdsI_rbtree_t`

**Parameters**

$T$	The red-black tree to compute the height from
-----	---

**Returns**

the height of the red-black tree  $T$  (noted  $h(T)$ ).

**See also**

`gdsI_rbtree_get_size()` (p. 214)

**Examples:**

`examples/main_rbtree.c`.

**4.15.4.9 `gdsI_rbtree_t gdsI_rbtree_set_name( gdsI_rbtree_t T, const char * NEW_NAME )`**

Set the name of a red-black tree.

Change the previous name of the red-black tree  $T$  to a copy of `NEW_NAME`.

**Note**

Complexity:  $O(1)$

**Precondition**

T must be a valid `gdsl_rbtrees_t`

**Parameters**

<i>T</i>	The red-black tree to change the name
<i>NEW_NAME</i>	The new name of T

**Returns**

the modified red-black tree in case of success.  
NULL in case of insufficient memory.

**See also**

**`gdsl_rbtrees_get_name()`** (p. 213)

#### 4.15.4.10 `gdsl_element_t gsdl_rbtrees_insert( gsdl_rbtrees_t T, void * VALUE, int * RESULT )`

Insert an element into a red-black tree if it's not found or return it.

Search for the first element E equal to VALUE into the red-black tree T, by using T's COMP\_F function passed to `gdsl_rbtrees_alloc` to find it. If E is found, then it's returned. If E isn't found, then a new element E is allocated using T's ALLOC\_F function passed to `gdsl_rbtrees_alloc` and is inserted and then returned.

**Note**

Complexity:  $O(\log(|T|))$

**Precondition**

T must be a valid `gdsl_rbtrees_t` & RESULT != NULL

**Parameters**

<i>T</i>	The red-black tree to modify
<i>VALUE</i>	The value used to make the new element to insert into T
<i>RESULT</i>	The address where the result code will be stored.

**Returns**

the element E and RESULT = GDSL\_OK if E is inserted into T.  
 the element E and RESULT = GDSL\_ERR\_DUPLICATE\_ENTRY if E is already present in T.  
 NULL and RESULT = GDSL\_ERR\_MEM\_ALLOC in case of insufficient memory.

**See also**

**gdsl\_rbtree\_remove()** (p. 217)

**gdsl\_rbtree\_delete()** (p. 218)

**Examples:**

**examples/main\_rbtree.c.**

4.15.4.11 **gsdl\_element\_t gsdl\_rbtree\_remove( gsdl\_rbtree\_t T, void \* VALUE )**

Remove an element from a red-black tree.

Remove from the red-black tree T the first founded element E equal to VALUE, by using T's COMP\_F function passed to **gsdl\_rbtree\_alloc()** (p. 210). If E is found, it is removed from T and then returned.

**Note**

Complexity:  $O(\log(|T|))$

**Precondition**

T must be a valid gsdl\_rbtree\_t

**Parameters**

<i>T</i>	The red-black tree to modify
<i>VALUE</i>	The value used to find the element to remove

**Returns**

the first founded element equal to VALUE in T in case is found.  
 NULL in case no element equal to VALUE is found in T.

**See also**

**gsdl\_rbtree\_insert()** (p. 216)

**gsdl\_rbtree\_delete()** (p. 218)

#### 4.15.4.12 `gdsI_rbtree_t gdsI_rbtree_delete( gdsI_rbtree_t T, void * VALUE )`

Delete an element from a red-black tree.

Remove from the red-black tree the first founded element E equal to VALUE, by using T's COMP\_F function passed to `gdsI_rbtree_alloc()` (p. 210). If E is found, it is removed from T and E is deallocated using T's FREE\_F function passed to `gdsI_rbtree_alloc()` (p. 210), then T is returned.

##### Note

Complexity:  $O(\log(|T|))$

##### Precondition

T must be a valid `gdsI_rbtree_t`

##### Parameters

<code>T</code>	The red-black tree to remove an element from
<code>VALUE</code>	The value used to find the element to remove

##### Returns

the modified red-black tree after removal of E if E was found.  
NULL if no element equal to VALUE was found.

##### See also

`gdsI_rbtree_insert()` (p. 216)  
`gdsI_rbtree_remove()` (p. 217)

##### Examples:

`examples/main_rbtree.c.`

#### 4.15.4.13 `gdsI_element_t gdsI_rbtree_search( const gdsI_rbtree_t T, gdsI_compare_func_t COMP_F, void * VALUE )`

Search for a particular element into a red-black tree.

Search the first element E equal to VALUE in the red-black tree T, by using COMP\_F function to find it. If COMP\_F == NULL, then the COMP\_F function passed to `gdsI_rbtree_alloc()` (p. 210) is used.

##### Note

Complexity:  $O(\log(|T|))$

**Precondition**

T must be a valid `gdsl_rbtrees_t`

**Parameters**

<i>T</i>	The red-black tree to use.
<i>COMP_F</i>	The comparison function to use to compare T's element with VALUE to find the element E (or NULL to use the default T's COMP_F)
<i>VALUE</i>	The value that must be used by COMP_F to find the element E

**Returns**

the first founded element E equal to VALUE.  
NULL if VALUE is not found in T.

**See also**

**`gdsl_rbtrees_insert()`** (p. 216)  
**`gdsl_rbtrees_remove()`** (p. 217)  
**`gdsl_rbtrees_delete()`** (p. 218)

**Examples:**

**`examples/main_rbtrees.c`**.

#### 4.15.4.14 `gdsl_element_t gsdl_rbtrees_map_prefix( const gsdl_rbtrees_t T, gsdl_map_func_t MAP_F, void * USER_DATA )`

Parse a red-black tree in prefixed order.

Parse all nodes of the red-black tree T in prefixed order. The MAP\_F function is called on the element contained in each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then **`gsdl_rbtrees_map_prefix()`** (p. 219) stops and returns its last examined element.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid `gdsl_rbtrees_t` & MAP\_F != NULL

**Parameters**

<i>T</i>	The red-black tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

**gdsl\_rbtrees\_map\_infix()** (p. 220)  
**gdsl\_rbtrees\_map\_postfix()** (p. 221)

**Examples:**

**examples/main\_rbtrees.c.**

#### 4.15.4.15 **gsdl\_element\_t gsdl\_rbtrees\_map\_infix ( const gsdl\_rbtrees\_t T, gsdl\_map\_func\_t MAP\_F, void \* USER\_DATA )**

Parse a red-black tree in infix order.

Parse all nodes of the red-black tree T in infix order. The MAP\_F function is called on the element contained in each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then **gsdl\_rbtrees\_map\_infix()** (p. 220) stops and returns its last examined element.

**Note**

Complexity:  $O(|T|)$

**Precondition**

T must be a valid gsdl\_rbtrees\_t & MAP\_F != NULL

**Parameters**

<i>T</i>	The red-black tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

**Returns**

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
 NULL when the parsing is done.

**See also**

**gsdl\_rbtrees\_map\_prefix()** (p. 219)  
**gsdl\_rbtrees\_map\_postfix()** (p. 221)

Examples:

**examples/main\_rbtrees.c.**

4.15.4.16 `gdsl_element_t` `gdsl_rbtrees_map_postfix( const gdsl_rbtrees_t T, gdsl_map_func_t MAP_F, void * USER_DATA )`

Parse a red-black tree in postfix order.

Parse all nodes of the red-black tree T in postfix order. The MAP\_F function is called on the element contained in each node with the USER\_DATA argument. If MAP\_F returns GDSL\_MAP\_STOP, then `gdsl_rbtrees_map_postfix()` (p. 221) stops and returns its last examined element.

Note

Complexity:  $O(|T|)$

Precondition

T must be a valid `gdsl_rbtrees_t` & MAP\_F != NULL

Parameters

<i>T</i>	The red-black tree to map.
<i>MAP_F</i>	The map function.
<i>USER_DATA</i>	User's datas passed to MAP_F

Returns

the first element for which MAP\_F returns GDSL\_MAP\_STOP.  
NULL when the parsing is done.

See also

`gdsl_rbtrees_map_prefix()` (p. 219)

`gdsl_rbtrees_map_infix()` (p. 220)

Examples:

**examples/main\_rbtrees.c.**

4.15.4.17 `void` `gdsl_rbtrees_write( const gdsl_rbtrees_t T, gdsl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the element of each node of a red-black tree to a file.

Write the nodes elements of the red-black tree *T* to *OUTPUT\_FILE*, using *WRITE\_F* function. Additionnal *USER\_DATA* argument could be passed to *WRITE\_F*.

#### Note

Complexity:  $O(|T|)$

#### Precondition

*T* must be a valid *gdsI\_rbtrees\_t* & *WRITE\_F* != NULL & *OUTPUT\_FILE* != NULL

#### Parameters

<i>T</i>	The red-black tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>T</i> 's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

#### See also

***gdsI\_rbtrees\_write\_xml()*** (p. 222)

***gdsI\_rbtrees\_dump()*** (p. 223)

#### Examples:

**examples/main\_rbtrees.c.**

4.15.4.18 ***void gdsI\_rbtrees\_write\_xml( const gdsI\_rbtrees\_t T, gdsI\_write\_func\_t WRITE\_F, FILE \* OUTPUT\_FILE, void \* USER\_DATA )***

Write the content of a red-black tree to a file into XML.

Write the nodes elements of the red-black tree *T* to *OUTPUT\_FILE*, into XML language. If *WRITE\_F* != NULL, then use *WRITE\_F* to write *T*'s nodes elements to *OUTPUT\_FILE*. Additionnal *USER\_DATA* argument could be passed to *WRITE\_F*.

#### Note

Complexity:  $O(|T|)$

#### Precondition

*T* must be a valid *gdsI\_rbtrees\_t* & *OUTPUT\_FILE* != NULL

#### Parameters

<i>T</i>	The red-black tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>T</i> 's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

**gdsI\_rbtrees\_write()** (p. 221)

**gdsI\_rbtrees\_dump()** (p. 223)

Examples:

**examples/main\_rbtrees.c.**

4.15.4.19 void **gdsI\_rbtrees\_dump** ( const **gdsI\_rbtrees\_t** *T*, **gdsI\_write\_func\_t** *WRITE\_F*,  
FILE \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Dump the internal structure of a red-black tree to a file.

Dump the structure of the red-black tree *T* to *OUTPUT\_FILE*. If *WRITE\_F* != NULL, then use *WRITE\_F* to write *T*'s nodes elements to *OUTPUT\_FILE*. Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

Note

Complexity:  $O(|T|)$

Precondition

*T* must be a valid **gdsI\_rbtrees\_t** & *OUTPUT\_FILE* != NULL

Parameters

<i>T</i>	The red-black tree to write.
<i>WRITE_F</i>	The write function.
<i>OUTPUT_FILE</i>	The file where to write <i>T</i> 's elements.
<i>USER_DATA</i>	User's datas passed to <i>WRITE_F</i> .

See also

**gdsI\_rbtree\_write()** (p. 221)

**gdsI\_rbtree\_write\_xml()** (p. 222)

Examples:

**examples/main\_rbtree.c.**

## 4.16 Sort module

### 4.16.1

#### 4.16.2 Copyright

#### Functions

- void **gdsl\_sort** (**gdsl\_element\_t**\*T, **ulong** N, const **gdsl\_compare\_func\_t** COMP\_F)

*Sort an array in place.*

#### 4.16.3 Function Documentation

4.16.3.1 void **gdsl\_sort** ( **gdsl\_element\_t**\* T, **ulong** N, const **gdsl\_compare\_func\_t** COMP\_F )

Sort an array in place.

Sort the array T in place. The function COMP\_F is used to compare T's elements and must be user-defined.

#### Note

Complexity:  $O(N \log(N))$

#### Precondition

$N == |T|$  &  $T \neq \text{NULL}$  &  $\text{COMP\_F} \neq \text{NULL}$  & for all  $i \leq N$ :  $\text{sizeof}(T[i]) == \text{sizeof}(\text{gdsl\_element\_t})$

#### Parameters

<i>T</i>	The array of elements to sort
<i>N</i>	The number of elements into T
<i>COMP_F</i>	The function pointer used to compare T's elements

Examples:

`examples/main_sort.c.`

## 4.17 Stack manipulation module

*Write the content of a stack to a file into XML.*
- void **gdsl\_stack\_dump** (gdsl\_stack\_t S, gdsl\_write\_func\_t WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)
 

*Dump the internal structure of a stack to a file.*

### 4.17.3 Typedef Documentation

#### 4.17.3.1 typedef struct \_gdsl\_stack\* gdsl\_stack\_t

GDSL stack type.

This type is voluntary opaque. Variables of this kind could'nt be directly used, but by the functions of this module.

Definition at line 72 of file gdsl\_stack.h.

#### 4.17.4 Function Documentation

##### 4.17.4.1 `gdsl_stack_t` `gdsl_stack_alloc( const char * NAME, gdsl_alloc_func_t ALLOC_F, gdsl_free_func_t FREE_F )`

Create a new stack.

Allocate a new stack data structure which name is set to a copy of NAME. The functions pointers ALLOC\_F and FREE\_F could be used to respectively, alloc and free elements in the stack. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing

#### Note

Complexity:  $O(1)$

#### Precondition

nothing.

#### Parameters

<i>NAME</i>	The name of the new stack to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in a stack
<i>FREE_F</i>	Function to free element when deleting it from a stack

#### Returns

the newly allocated stack in case of success.  
NULL in case of insufficient memory.

#### See also

**`gdsl_stack_free()`** (p. 229)  
**`gdsl_stack_flush()`** (p. 230)

#### Examples:

**`examples/main_stack.c`**.

##### 4.17.4.2 `void` `gdsl_stack_free( gdsl_stack_t S )`

Destroy a stack.

Deallocate all the elements of the stack S by calling S's FREE\_F function passed to **`gdsl_stack_alloc()`** (p. 229). The name of S is deallocated and S is deallocated itself too.

## Note

Complexity:  $O(|S|)$

## Precondition

S must be a valid `gdsl_stack_t`

## Parameters

S	The stack to destroy
---	----------------------

## See also

**`gdsl_stack_alloc()`** (p. 229)

**`gdsl_stack_flush()`** (p. 230)

## Examples:

**`examples/main_stack.c`**.

#### 4.17.4.3 void `gdsl_stack_flush( gdsi_stack_t S )`

Flush a stack.

Deallocate all the elements of the stack S by calling S's `FREE_F` function passed to **`gdsl_stack_alloc()`** (p. 229). S is not deallocated itself and S's name is not modified.

## Note

Complexity:  $O(|S|)$

## Precondition

S must be a valid `gdsi_stack_t`

## Parameters

S	The stack to flush
---	--------------------

## See also

**`gdsl_stack_alloc()`** (p. 229)

**`gdsl_stack_free()`** (p. 229)

## Examples:

**`examples/main_stack.c`**.

#### 4.17.4.4 `const char* gdsI_stack_get_name( const gdsI_stack_t S )`

Getsthe name of a stack.

##### Note

Complexity:  $O( 1 )$

##### Precondition

Q must be a valid `gdsI_stack_t`

##### Postcondition

The returned string MUST NOT be freed.

##### Parameters

S	The stack to get the name from
---	--------------------------------

##### Returns

the name of the stack S.

##### See also

**`gdsI_stack_set_name()`** (p. 234)

##### Examples:

**`examples/main_stack.c`**.

#### 4.17.4.5 `ulong gdsI_stack_get_size( const gdsI_stack_t S )`

Get the size of a stack.

##### Note

Complexity:  $O( 1 )$

##### Precondition

S must be a valid `gdsI_stack_t`

##### Parameters

S	The stack to get the size from
---	--------------------------------

**Returns**

the number of elements of the stack  $S$  (noted  $|S|$ ).

**4.17.4.6 `ulong gdsI_stack_get_growing_factor( const gdsI_stack_t S )`**

Get the growing factor of a stack.

Get the growing factor of the stack  $S$ . This value is the amount of cells to reserve for next insertions. For example, if you set this value to 10, each time the number of elements of  $S$  reaches 10, then 10 new cells will be reserved for next 10 insertions. It is a way to save time for insertions. This value is 1 by default and can be modified with **`gdsI_stack_set_growing_factor()`** (p. 235).

**Note**

Complexity:  $O(1)$

**Precondition**

$S$  must be a valid `gdsI_stack_t`

**Parameters**

$S$	The stack to get the growing factor from
-----	--

**Returns**

the growing factor of the stack  $S$ .

**See also**

**`gdsI_stack_insert()`** (p. 235)

**`gdsI_stack_set_growing_factor()`** (p. 235)

**4.17.4.7 `bool gdsI_stack_is_empty( const gdsI_stack_t S )`**

Check if a stack is empty.

**Note**

Complexity:  $O(1)$

**Precondition**

$S$  must be a valid `gdsI_stack_t`

## Parameters

S	The stack to check
---	--------------------

## Returns

TRUE if the stack S is empty.  
FALSE if the stack S is not empty.

## Examples:

**examples/main\_stack.c.**

4.17.4.8 `gdsI_element_t gdsI_stack_get_top( const gdsI_stack_t S )`

Get the top of a stack.

## Note

Complexity:  $O(1)$

## Precondition

S must be a valid `gdsI_stack_t`

## Parameters

S	The stack to get the top from
---	-------------------------------

## Returns

the element contained at the top position of the stack S if S is not empty. The returned element is not removed from S.  
NULL if the stack S is empty.

## See also

**`gdsI_stack_get_bottom()`** (p. 233)

## Examples:

**examples/main\_stack.c.**

4.17.4.9 `gdsI_element_t gdsI_stack_get_bottom( const gdsI_stack_t S )`

Get the bottom of a stack.

**Note**

Complexity:  $O(1)$

**Precondition**

S must be a valid `gdsl_stack_t`

**Parameters**

S	The stack to get the bottom from
---	----------------------------------

**Returns**

the element contained at the bottom position of the stack S if S is not empty. The returned element is not removed from S.  
 NULL if the stack S is empty.

**See also**

**`gdsl_stack_get_top()`** (p. 233)

#### 4.17.4.10 `gdsl_stack_t` `gdsl_stack_set_name` ( `gdsl_stack_t` S, const char \* *NEW\_NAME* )

Set the name of a stack.

Change the previous name of the stack S to a copy of *NEW\_NAME*.

**Note**

Complexity:  $O(1)$

**Precondition**

S must be a valid `gdsl_stack_t`

**Parameters**

S	The stack to change the name
<i>NEW_NAME</i>	The new name of S

**Returns**

the modified stack in case of success.  
 NULL in case of insufficient memory.

See also

**gdsl\_stack\_get\_name()** (p. 231)

#### 4.17.4.11 void **gdsl\_stack\_set\_growing\_factor**( **gdsl\_stack\_t** *S*, **ulong** *G* )

Set the growing factor of a stack.

Set the growing factor of the stack *S*. This value is the amount of cells to reserve for next insertions. For example, if you set this value to 10, each time the number of elements of *S* reaches 10, then 10 new cells will be reserved for next 10 insertions. It is a way to save time for insertions. To know the actual value of the growing factor, use **gdsl\_stack\_get\_growing\_factor()** (p. 232)

Note

Complexity:  $O(1)$

Precondition

*S* must be a valid **gdsl\_stack\_t**

Parameters

<i>S</i>	The stack to get the growing factor from
<i>G</i>	The new growing factor of <i>S</i> .

Returns

the growing factor of the stack *S*.

See also

**gdsl\_stack\_insert()** (p. 235)

**gdsl\_stack\_get\_growing\_factor()** (p. 232)

#### 4.17.4.12 **gdsl\_element\_t** **gdsl\_stack\_insert**( **gdsl\_stack\_t** *S*, **void \*** *VALUE* )

Insert an element in a stack (PUSH).

Allocate a new element *E* by calling *S*'s **ALLOC\_F** function on *VALUE*. **ALLOC\_F** is the function pointer passed to **gdsl\_stack\_alloc()** (p. 229). The new element *E* is the inserted at the top position of the stack *S*. If the number of elements in *S* reaches *S*'s growing factor (*G*), then *G* new cells are reserved for future insertions into *S* to save time.

**Note**

Complexity:  $O(1)$

**Precondition**

S must be a valid `gdsl_stack_t`

**Parameters**

<i>S</i>	The stack to insert in
<i>VALUE</i>	The value used to make the new element to insert into S

**Returns**

the inserted element E in case of success.  
NULL in case of insufficient memory.

**See also**

**`gdsl_stack_set_growing_factor()`** (p. 235)  
**`gdsl_stack_get_growing_factor()`** (p. 232)  
**`gdsl_stack_remove()`** (p. 236)

**Examples:**

**`examples/main_stack.c`**.

**4.17.4.13 `gdsl_element_t` `gdsl_stack_remove( gdsl_stack_t S )`**

Remove an element from a stack (POP).

Remove the element at the top position of the stack S.

**Note**

Complexity:  $O(1)$

**Precondition**

S must be a valid `gdsl_stack_t`

**Parameters**

<i>S</i>	The stack to remove the top from
----------	----------------------------------

**Returns**

the removed element in case of success.  
NULL in case of S is empty.

**See also**

**gdsI\_stack\_insert()** (p. 235)

**Examples:**

**examples/main\_stack.c.**

**4.17.4.14 gdsI\_element\_t gdsI\_stack\_search( const gdsI\_stack\_t S,  
gdsI\_compare\_func\_t COMP\_F, void \* VALUE )**

Search for a particular element in a stack.

Search for the first element E equal to VALUE in the stack S, by using COMP\_F to compare all S's element with.

**Note**

Complexity:  $O(|S|)$

**Precondition**

S must be a valid gdsI\_stack\_t & COMP\_F != NULL

**Parameters**

<i>S</i>	The stack to search the element in
<i>COMP_F</i>	The comparison function used to compare S's element with VALUE
<i>VALUE</i>	The value to compare S's elements with

**Returns**

the first founded element E in case of success.  
NULL if no element is found.

**See also**

**gdsI\_stack\_search\_by\_position()** (p. 237)

**4.17.4.15 gdsI\_element\_t gdsI\_stack\_search\_by\_position( const gdsI\_stack\_t S,  
ulong POS )**

Search for an element by its position in a stack.

**Note**

Complexity:  $O(1)$

**Precondition**

S must be a valid `gdsl_stack_t` &  $POS > 0$  &  $POS \leq |S|$

**Parameters**

<i>S</i>	The stack to search the element in
<i>POS</i>	The position where is the element to search

**Returns**

the element at the *POS*-th position in the stack *S*.  
 NULL if  $POS > |L|$  or  $POS \leq 0$ .

**See also**

**`gdsl_stack_search()`** (p. 237)

**Examples:**

**`examples/main_stack.c`**.

#### 4.17.4.16 `gdsl_element_t` `gdsl_stack_map_forward` ( `const` `gdsl_stack_t` *S*, `gdsl_map_func_t` *MAP\_F*, `void *` *USER\_DATA* )

Parse a stack from bottom to top.

Parse all elements of the stack *S* from bottom to top. The *MAP\_F* function is called on each *S*'s element with *USER\_DATA* argument. If *MAP\_F* returns `GDSL_MAP_STOP`, then **`gdsl_stack_map_forward()`** (p. 238) stops and returns its last examined element.

**Note**

Complexity:  $O(|S|)$

**Precondition**

S must be a valid `gdsl_stack_t` & *MAP\_F* != NULL

**Parameters**

<i>S</i>	The stack to parse
<i>MAP_F</i>	The map function to apply on each <i>S</i> 's element
<i>USER_DATA</i>	User's datas passed to <i>MAP_F</i> Returns the first element for which <i>M-</i>
<i>A</i>	<i>AP_F</i> returns <code>GDSL_MAP_STOP</code> Returns NULL when the parsing is done.

See also

**gdsl\_stack\_map\_backward()** (p. 239)

Examples:

**examples/main\_stack.c.**

4.17.4.17 **gdsl\_element\_t** **gdsl\_stack\_map\_backward**( const **gdsl\_stack\_t** *S*,  
**gdsl\_map\_func\_t** *MAP\_F*, void \* *USER\_DATA* )

Parse a stack from top to bottom.

Parse all elements of the stack *S* from top to bottom. The *MAP\_F* function is called on each *S*'s element with *USER\_DATA* argument. If *MAP\_F* returns **GDSL\_MAP\_STOP**, then **gdsl\_stack\_map\_backward()** (p. 239) stops and returns its last examined element.

Note

Complexity:  $O(|S|)$

Precondition

*S* must be a valid **gdsl\_stack\_t** & *MAP\_F* != NULL

Parameters

<i>S</i>	The stack to parse
<i>MAP_F</i>	The map function to apply on each <i>S</i> 's element
<i>USER_DATA</i>	User's datas passed to <i>MAP_F</i>
<i>A</i>	

Returns

the first element for which *MAP\_F* returns **GDSL\_MAP\_STOP**.  
NULL when the parsing is done.

See also

**gdsl\_stack\_map\_forward()** (p. 238)

4.17.4.18 **void** **gdsl\_stack\_write**( const **gdsl\_stack\_t** *S*, **gdsl\_write\_func\_t** *WRITE\_F*,  
**FILE** \* *OUTPUT\_FILE*, void \* *USER\_DATA* )

Write all the elements of a stack to a file.

Write the elements of the stack *S* to *OUTPUT\_FILE*, using *WRITE\_F* function. -  
Additional *USER\_DATA* argument could be passed to *WRITE\_F*.

**Note**

Complexity:  $O(|S|)$

**Precondition**

S must be a valid `gdsl_stack_t` & `OUTPUT_FILE != NULL` & `WRITE_F != NULL`

**Parameters**

<code>S</code>	The stack to write.
<code>WRITE_F</code>	The write function.
<code>OUTPUT_FILE</code>	The file where to write S's elements.
<code>USER_DATA</code>	User's datas passed to <code>WRITE_F</code> .

**See also**

**`gdsl_stack_write_xml()`** (p. 240)

**`gdsl_stack_dump()`** (p. 241)

4.17.4.19 `void gdsl_stack_write_xml( gdsl_stack_t S, gdsl_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Write the content of a stack to a file into XML.

Write the elements of the stack S to `OUTPUT_FILE`, into XML language. If `WRITE_F != NULL`, then uses `WRITE_F` to write S's elements to `OUTPUT_FILE`. Additional `USER_DATA` argument could be passed to `WRITE_F`.

**Note**

Complexity:  $O(|S|)$

**Precondition**

S must be a valid `gdsl_stack_t` & `OUTPUT_FILE != NULL`

**Parameters**

<code>S</code>	The stack to write.
<code>WRITE_F</code>	The write function.
<code>OUTPUT_FILE</code>	The file where to write S's elements.
<code>USER_DATA</code>	User's datas passed to <code>WRITE_F</code> .

See also

**gdsl\_stack\_write()** (p. 239)

**gdsl\_stack\_dump()** (p. 241)

Examples:

**examples/main\_stack.c.**

4.17.4.20 `void gdsi_stack_dump( gdsi_stack_t S, gdsi_write_func_t WRITE_F, FILE * OUTPUT_FILE, void * USER_DATA )`

Dump the internal structure of a stack to a file.

Dump the structure of the stack S to OUTPUT\_FILE. If WRITE\_F != NULL, then uses WRITE\_F to write S's elements to OUTPUT\_FILE. Additional USER\_DATA argument could be passed to WRITE\_F.

Note

Complexity:  $O(|S|)$

Precondition

S must be a valid gdsi\_stack\_t & OUTPUT\_FILE != NULL

Parameters

S	The stack to write.
WRITE_F	The write function.
OUTPUT_FILE	The file where to write S's elements.
USER_DATA	User's datas passed to WRITE_F.

See also

**gdsi\_stack\_write()** (p. 239)

**gdsi\_stack\_write\_xml()** (p. 240)

Examples:

**examples/main\_stack.c.**

## 4.18 GDSL types

*GDSL Constants.*

- enum `gdsl_location_t` { `GDSL_LOCATION_UNDEF = 0`, `GDSL_LOCATION_HEAD = 1`, `GDSL_LOCATION_ROOT = 1`, `GDSL_LOCATION_TOP = 1`, `GDSL_LOCATION_TAIL = 2`, `GDSL_LOCATION_LEAF = 2`, `GDSL_LOCATION_BOTTOM = 2`, `GDSL_LOCATION_FIRST = 1`, `GDSL_LOCATION_LAST = 2`, `GDSL_LOCATION_FIRST_COL = 1`, `GDSL_LOCATION_LAST_COL = 2`, `GDSL_LOCATION_FIRST_ROW = 4`, `GDSL_LOCATION_LAST_ROW = 8` }
- enum `bool` { `FALSE = 0`, `TRUE = 1` }

### 4.18.3 Typedef Documentation

#### 4.18.3.1 typedef void\* `gsdl_element_t`

GDSL element type.

All GDSL internal data structures contains a field of this type. This field is for GDSL users to store their data into GDSL data structures.

Definition at line 146 of file `gsdl_types.h`.

#### 4.18.3.2 typedef `gsdl_element_t(*gsdl_alloc_func_t)(void *USER_DATA)`

GDSL Alloc element function type.

This function type is for allocating a new `gsdl_element_t` variable. The `USER_DATA` argument should be used to fill-in the new element.

##### Parameters

<code>USER_DATA</code>	user data used to create the new element.
------------------------	---

##### Returns

the newly allocated element in case of success.  
NULL in case of failure.

##### See also

[gsdl\\_free\\_func\\_t](#) (p. 243)

Definition at line 160 of file `gsdl_types.h`.

#### 4.18.3.3 typedef void(\* `gsdl_free_func_t`)(`gsdl_element_t`)

GDSL Free element function type.

This function type is for freeing a `gsdl_element_t` variable. The element must have been previously allocated by a function of `gsdl_alloc_func_t` type. A free function according to `gsdl_free_func_t` must free the resources allocated by the corresponding call to the

function of type `gdsl_alloc_func_t`. The GDSL functions doesn't check if `E != NULL` before calling this function.

#### Parameters

<i>E</i>	The element to deallocate.
----------	----------------------------

#### See also

**`gdsl_alloc_func_t`** (p. 243)

Definition at line 178 of file `gdsl_types.h`.

#### 4.18.3.4 `typedef gsdl_element_t(*gsdl_copy_func_t)(const gsdl_element_t E)`

GDSL Copy element function type.

This function type is for copying `gsdl_element_t` variables.

#### Parameters

<i>E</i>	The <code>gsdl_element_t</code> variable to copy.
----------	---

#### Returns

the copied element in case of success.  
NULL in case of failure.

Definition at line 191 of file `gdsl_types.h`.

#### 4.18.3.5 `typedef int(*gsdl_map_func_t)(const gsdl_element_t E, gsdl_location_t LOCATION, void *USER_DATA)`

GDSL Map element function type.

This function type is for mapping a `gsdl_element_t` variable from a GDSL data structure. The optional `USER_DATA` could be used to do special thing if needed.

#### Parameters

<i>E</i>	The actually mapped <code>gsdl_element_t</code> variable.
<i>LOCATION</i>	The location of <code>E</code> in the data structure.
<i>USER_DATA</i>	User's datas.

#### Returns

`GDSL_MAP_STOP` if the mapping must be stopped.  
`GDSL_MAP_CONT` if the mapping must be continued.

Definition at line 208 of file gdsl\_types.h.

4.18.3.6 `typedef long int(* gdsl_compare_func_t)(const gdsl_element_t E, void *VALUE)`

GDSL Comparison element function type.

This function type is used to compare a `gdsl_element_t` variable with a user value. The `E` argument is always the one in the GDSL data structure, `VALUE` is always the one the user wants to compare `E` with.

#### Parameters

<code>E</code>	The <code>gdsl_element_t</code> variable contained into the data structure to compare from.
<code>VALUE</code>	The user data to compare <code>E</code> with.

#### Returns

- < 0 if `E` is assumed to be less than `VALUE`.
- 0 if `E` is assumed to be equal to `VALUE`.
- > 0 if `E` is assumed to be greater than `VALUE`.

Definition at line 229 of file gdsl\_types.h.

4.18.3.7 `typedef void(* gdsl_write_func_t)(const gdsl_element_t E, FILE *OUTPUT_FILE, gdsl_location_t LOCATION, void *USER_DATA)`

GDSL Write element function type.

This function type is for writing a `gdsl_element_t E` to `OUTPUT_FILE`. Additional `USER_DATA` could be passed to it.

#### Parameters

<code>E</code>	The <code>gdsl</code> element to write.
<code>OUTPUT_FILE</code>	The file where to write <code>E</code> .
<code>LOCATION</code>	The location of <code>E</code> in the data structure.
<code>USER_DATA</code>	User's datas.

Definition at line 245 of file gdsl\_types.h.

4.18.3.8 `typedef unsigned long int ulong`

Definition at line 258 of file gdsl\_types.h.

#### 4.18.3.9 typedef unsigned short int ushort

Definition at line 262 of file gdsl\_types.h.

### 4.18.4 Enumeration Type Documentation

#### 4.18.4.1 enum gdsl\_constant\_t

GDSL Constants.

Enumerator:

**GDSL\_ERR\_MEM\_ALLOC** Memory allocation error

**GDSL\_MAP\_STOP** For stopping a parsing function

**GDSL\_MAP\_CONT** For continuing a parsing function

**GDSL\_INSERTED** To indicate an inserted value

**GDSL\_FOUND** To indicate a founded value

Definition at line 64 of file gdsl\_types.h.

#### 4.18.4.2 enum gdsl\_location\_t

Enumerator:

**GDSL\_LOCATION\_UNDEF** Element position undefined

**GDSL\_LOCATION\_HEAD** Element is at head position

**GDSL\_LOCATION\_ROOT** Element is on leaf position

**GDSL\_LOCATION\_TOP** Element is at top position

**GDSL\_LOCATION\_TAIL** Element is at tail position

**GDSL\_LOCATION\_LEAF** Element is on root position

**GDSL\_LOCATION\_BOTTOM** Element is at bottom position

**GDSL\_LOCATION\_FIRST** Element is the first

**GDSL\_LOCATION\_LAST** Element is the last

**GDSL\_LOCATION\_FIRST\_COL** Element is on first column

**GDSL\_LOCATION\_LAST\_COL** Element is on last column

**GDSL\_LOCATION\_FIRST\_ROW** Element is on first row

**GDSL\_LOCATION\_LAST\_ROW** Element is on last row

Definition at line 85 of file gdsl\_types.h.

## 4.18.4.3 enum bool

GDSL boolean type. Defines `_NO_LIBGDSL_TYPES_` at compilation time if you don't want them.

Enumerator:

**FALSE** FALSE boolean value

**TRUE** TRUE boolean value

Definition at line 283 of file `gdsl_types.h`.

## Chapter 5

# File Documentation

### 5.1 `_gdsl_bintree.h` File Reference

#### Typedefs

- typedef struct `_gdsl_bintree` \* **`_gdsl_bintree_t`**  
*GDSL low-level binary tree type.*
- typedef int(\* **`_gdsl_bintree_map_func_t`**)(const **`_gdsl_bintree_t`** TREE, void \*USER\_DATA)  
*GDSL low-level binary tree map function type.*
- typedef void(\* **`_gdsl_bintree_write_func_t`**)(const **`_gdsl_bintree_t`** TREE, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*GDSL low-level binary tree write function type.*

#### Functions

- **`_gdsl_bintree_t _gdsl_bintree_alloc`** (const **`gdsl_element_t`** E, const **`_gdsl_bintree_t`** LEFT, const **`_gdsl_bintree_t`** RIGHT)  
*Create a new low-level binary tree.*
- void **`_gdsl_bintree_free`** (**`_gdsl_bintree_t`** T, const **`gdsl_free_func_t`** FREE\_F)  
*Destroy a low-level binary tree.*
- **`_gdsl_bintree_t _gdsl_bintree_copy`** (const **`_gdsl_bintree_t`** T, const **`gdsl_copy_func_t`** COPY\_F)  
*Copy a low-level binary tree.*
- **`bool _gdsl_bintree_is_empty`** (const **`_gdsl_bintree_t`** T)  
*Check if a low-level binary tree is empty.*
- **`bool _gdsl_bintree_is_leaf`** (const **`_gdsl_bintree_t`** T)  
*Check if a low-level binary tree is reduced to a leaf.*
- **`bool _gdsl_bintree_is_root`** (const **`_gdsl_bintree_t`** T)

*Check if a low-level binary tree is a root.*

- **gdsl\_element\_t\_gdsl\_bintree\_get\_content** (const\_gdsl\_bintree\_t T)  
*Get the root content of a low-level binary tree.*
- **gdsl\_bintree\_t\_gdsl\_bintree\_get\_parent** (const\_gdsl\_bintree\_t T)  
*Get the parent tree of a low-level binary tree.*
- **gdsl\_bintree\_t\_gdsl\_bintree\_get\_left** (const\_gdsl\_bintree\_t T)  
*Get the left sub-tree of a low-level binary tree.*
- **gdsl\_bintree\_t\_gdsl\_bintree\_get\_right** (const\_gdsl\_bintree\_t T)  
*Get the right sub-tree of a low-level binary tree.*

## 5.2 `_gdsI_bstree.h` File Reference

### Typedefs

- typedef `_gdsI_bintree_t` `_gdsI_bstree_t`  
*GDSL low-level binary search tree type.*
- typedef int(\* `_gdsI_bstree_map_func_t`)(\_gdsI\_bstree\_t TREE, void \*USER\_DATA)  
*GDSL low-level binary search tree map function type.*
- typedef void(\* `_gdsI_bstree_write_func_t`)(\_gdsI\_bstree\_t TREE, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*GDSL low-level binary search tree write function type.*

### Functions

- `_gdsI_bstree_t` `_gdsI_bstree_alloc` (const `gdsI_element_t` E)  
*Create a new low-level binary search tree.*
- void `_gdsI_bstree_free` (`_gdsI_bstree_t` T, const `gdsI_free_func_t` FREE\_F)  
*Destroy a low-level binary search tree.*
- `_gdsI_bstree_t` `_gdsI_bstree_copy` (const `_gdsI_bstree_t` T, const `gdsI_copy_func_t` COPY\_F)  
*Copy a low-level binary search tree.*
- bool `_gdsI_bstree_is_empty` (const `_gdsI_bstree_t` T)  
*Check if a low-level binary search tree is empty.*
- bool `_gdsI_bstree_is_leaf` (const `_gdsI_bstree_t` T)  
*Check if a low-level binary search tree is reduced to a leaf.*
- `gdsI_element_t` `_gdsI_bstree_get_content` (const `_gdsI_bstree_t` T)  
*Get the root content of a low-level binary search tree.*
- bool `_gdsI_bstree_is_root` (const `_gdsI_bstree_t` T)  
*Check if a low-level binary search tree is a root.*
- `_gdsI_bstree_t` `_gdsI_bstree_get_parent` (const `_gdsI_bstree_t` T)  
*Get the parent tree of a low-level binary search tree.*
- `_gdsI_bstree_t` `_gdsI_bstree_get_left` (const `_gdsI_bstree_t` T)

- Get the left sub-tree of a low-level binary search tree.*

  - **`_gdsl_bstree_t _gdsl_bstree_get_right`** (const **`_gdsl_bstree_t`** T)
- Get the right sub-tree of a low-level binary search tree.*

  - **`ulong _gdsl_bstree_get_size`** (const **`_gdsl_bstree_t`** T)
- Get the size of a low-level binary search tree.*

  - **`ulong _gdsl_bstree_get_height`** (const **`_gdsl_bstree_t`** T)
- Get the height of a low-level binary search tree.*

  - **`_gdsl_bstree_t _gdsl_bstree_insert`** (**`_gdsl_bstree_t`** \*T, const **`gdsl_compare_func_t`** COMP\_F, const **`gdsl_element_t`** VALUE, int \*RESULT)
- Insert an element into a low-level binary search tree if it's not found or return it.*

  - **`gdsl_element_t _gdsl_bstree_remove`** (**`_gdsl_bstree_t`** \*T, const **`gdsl_compare_func_t`** COMP\_F, const **`gdsl_element_t`** VALUE)
- Remove an element from a low-level binary search tree.*

  - **`_gdsl_bstree_t _gdsl_bstree_search`** (const **`_gdsl_bstree_t`** T, const **`gdsl_compare_func_t`** COMP\_F, const **`gdsl_element_t`** VALUE)
- Search for a particular element into a low-level binary search tree.*

  - **`_gdsl_bstree_t _gdsl_bstree_search_next`** (const **`_gdsl_bstree_t`** T, const **`gdsl_compare_func_t`** COMP\_F, const **`gdsl_element_t`** VALUE)
- Search for the next element of a particular element into a low-level binary search tree, according to the binary search tree order.*

  - **`_gdsl_bstree_t _gdsl_bstree_map_prefix`** (const **`_gdsl_bstree_t`** T, const **`_gdsl_bstree_map_func_t`** MAP\_F, void \*USER\_DATA)
- Parse a low-level binary search tree in prefixed order.*

  - **`_gdsl_bstree_t _gdsl_bstree_map_infix`** (const **`_gdsl_bstree_t`** T, const **`_gdsl_bstree_map_func_t`** MAP\_F, void \*USER\_DATA)
- Parse a low-level binary search tree in infix order.*

  - **`_gdsl_bstree_t _gdsl_bstree_map_postfix`** (const **`_gdsl_bstree_t`** T, const **`_gdsl_bstree_map_func_t`** MAP\_F, void \*USER\_DATA)
- Parse a low-level binary search tree in postfix order.*

  - **`void _gdsl_bstree_write`** (const **`_gdsl_bstree_t`** T, const **`_gdsl_bstree_write_func_t`** WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)
- Write the content of all nodes of a low-level binary search tree to a file.*

  - **`void _gdsl_bstree_write_xml`** (const **`_gdsl_bstree_t`** T, const **`_gdsl_bstree_write_func_t`** WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)
- Write the content of a low-level binary search tree to a file into XML.*

  - **`void _gdsl_bstree_dump`** (const **`_gdsl_bstree_t`** T, const **`_gdsl_bstree_write_func_t`** WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)
- Dump the internal structure of a low-level binary search tree to a file.*

### 5.3 `_gdsl_list.h` File Reference

#### Typedefs

- typedef **`_gdsl_node_t _gdsl_list_t`**  
*GDSL low-level doubly-linked list type.*

## Functions

- **`_gdsl_list_t _gdsl_list_alloc`** (const `gdsl_element_t` E)  
*Create a new low-level list.*
- **`void _gdsl_list_free`** (`_gdsl_list_t` L, const `gdsl_free_func_t` FREE\_F)  
*Destroy a low-level list.*
- **`bool _gdsl_list_is_empty`** (const `_gdsl_list_t` L)  
*Check if a low-level list is empty.*
- **`ulong _gdsl_list_get_size`** (const `_gdsl_list_t` L)  
*Get the size of a low-level list.*
- **`void _gdsl_list_link`** (`_gdsl_list_t` L1, `_gdsl_list_t` L2)  
*Link two low-level lists together.*
- **`void _gdsl_list_insert_after`** (`_gdsl_list_t` L, `_gdsl_list_t` PREV)  
*Insert a low-level list after another one.*
- **`void _gdsl_list_insert_before`** (`_gdsl_list_t` L, `_gdsl_list_t` SUCC)  
*Insert a low-level list before another one.*
- **`void _gdsl_list_remove`** (`_gdsl_node_t` NODE)  
*Remove a node from a low-level list.*
- **`_gdsl_list_t _gdsl_list_search`** (`_gdsl_list_t` L, const `gdsl_compare_func_t` COMP\_F, void \*VALUE)  
*Search for a particular node in a low-level list.*
- **`_gdsl_list_t _gdsl_list_map_forward`** (const `_gdsl_list_t` L, const `_gdsl_node_map_func_t` MAP\_F, void \*USER\_DATA)  
*Parse a low-level list in forward order.*
- **`_gdsl_list_t _gdsl_list_map_backward`** (const `_gdsl_list_t` L, const `_gdsl_node_map_func_t` MAP\_F, void \*USER\_DATA)  
*Parse a low-level list in backward order.*
- **`void _gdsl_list_write`** (const `_gdsl_list_t` L, const `_gdsl_node_write_func_t` WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*Write all nodes of a low-level list to a file.*
- **`void _gdsl_list_write_xml`** (const `_gdsl_list_t` L, const `_gdsl_node_write_func_t` WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*Write all nodes of a low-level list to a file into XML.*
- **`void _gdsl_list_dump`** (const `_gdsl_list_t` L, const `_gdsl_node_write_func_t` WRITE\_F, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*Dump the internal structure of a low-level list to a file.*

## 5.4 `_gdsl_node.h` File Reference

### Typedefs

- **`typedef struct _gdsl_node * _gdsl_node_t`**  
*GDSL low-level doubly linked node type.*

- typedef int(\* **\_gdsl\_node\_map\_func\_t**)(const **\_gdsl\_node\_t** NODE, void \*USER\_DATA)  
*GDSL low-level doubly-linked node map function type.*
- typedef void(\* **\_gdsl\_node\_write\_func\_t**)(const **\_gdsl\_node\_t** NODE, FILE \*OUTPUT\_FILE, void \*USER\_DATA)  
*GDSL low-level doubly-linked node write function type.*

## Functions

- **\_gdsl\_node\_t \_gdsl\_node\_alloc** (void)  
*Create a new low-level node.*
- **gdsl\_element\_t \_gdsl\_node\_free** (**\_gdsl\_node\_t** NODE)  
*Destroy a low-level node.*
- **\_gdsl\_node\_t \_gdsl\_node\_get\_succ** (const **\_gdsl\_node\_t** NODE)  
*Get the successor of a low-level node.*
- **\_gdsl\_node\_t \_gdsl\_node\_get\_pred** (const **\_gdsl\_node\_t** NODE)  
*Get the predecessor of a low-level node.*
- **gdsl\_element\_t \_gdsl\_node\_get\_content** (const **\_gdsl\_node\_t** NODE)  
*Get the content of a low-level node.*
- void **\_gdsl\_node\_set\_succ** (**\_gdsl\_node\_t** NODE, const **\_gdsl\_node\_t** SUC-C)  
*Set the successor of a low-level node.*
- void **\_gdsl\_node\_set\_pred** (**\_gdsl\_node\_t** NODE, const **\_gdsl\_node\_t** PRE-D)  
*Set the predecessor of a low-level node.*
- void **\_gdsl\_node\_set\_content** (**\_gdsl\_node\_t** NODE, const **gdsl\_element\_t** -CONTENT)  
*Set the content of a low-level node.*
- void **\_gdsl\_node\_link** (**\_gdsl\_node\_t** NODE1, **\_gdsl\_node\_t** NODE2)  
*Link two low-level nodes together.*
